

Successful Field and Lab Tests of a Multi-Process Phytoremediation System for Decontamination of Petroleum and Salt Impacted Soils

Bruce Greenberg, Xiao-Dong Huang, George Dixon,
Perry Gerwing and Bernie Glick

Partners: Imperial Oil; Talisman Energy; ConocoPhillips Canada; Northrock Resources; Canetic Resources; BASF; EBA; OAFT; Stantec; Ontario Ginseng Growers, CRA; Region of Waterloo; City of Guelph; NSERC

Development and Proof of the Multi-Process Phytoremediation System (MPPS)

1. 6 Years of Lab Studies

1. Soil spiked with creosote (PAHs)
2. Total Petrol. Hydrocarbon (TPH) contam. soil
3. PAH contaminated soil from urban foundry
4. Plant growth on salt impacted soils

2. 3 Years of Field Studies

1. TPH, Talisman Energy, Turner Valley, AB 2005-06
2. TPH, North East Alberta 2005-06
3. TPH, Imperial Oil Land Farm, Sarnia, ON 2004-06
4. DDT, Simcoe, ON 2005

Advantages of Phytoremediation

1. Improves the natural structure and texture of soil
2. It is driven by solar energy and suitable to most regions and climates
3. It is low in cost and technically feasible
4. Plants can provide sufficient biomass for rapid remediation; promote high rhizosphere activity
5. Restoration
6. > 30,000 sites in Canada where such technology is needed, > 300,000 sites in the US

Description of the Multi-Process Phytoremediation System (MPPS)

Physical soil treatment: Till the soil: exposure to sunlight and air
Exposure to sunlight photooxidizes contaminants

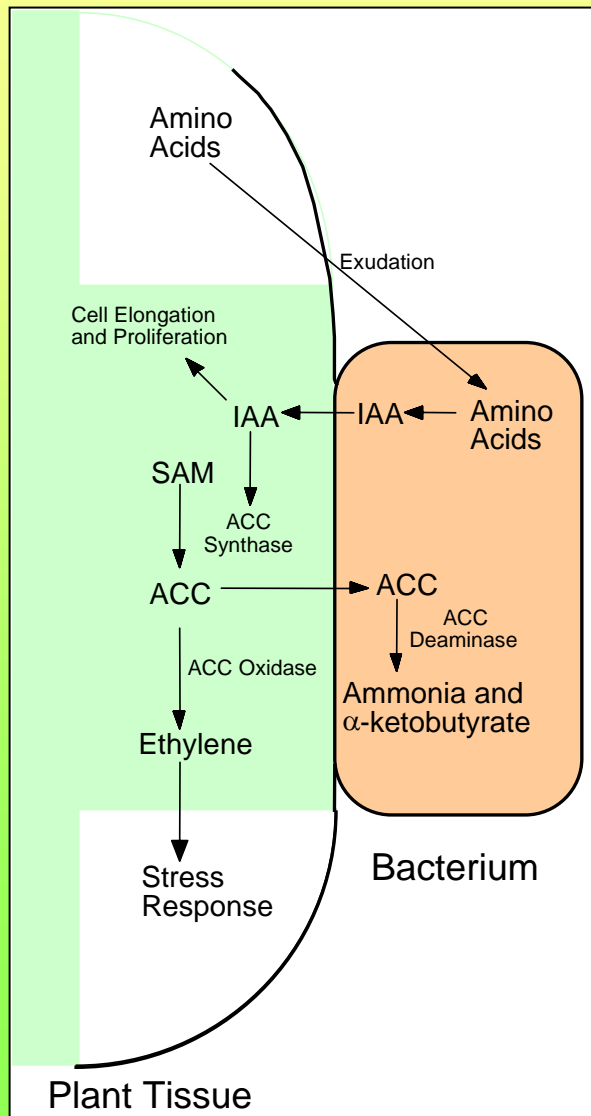

Bioremediation: Inoculation of PAH/TPH degrading bacteria

Phytoremediation: Growth of plants alone on the soil

MPPS: Land farming the soil for two weeks
Inoculation of PAH degrading bacteria
Growth of plants with PGPR

PGPR: Plant growth promoting rhizobacteria.
Prevents the synthesis of stress ethylene.

Interaction of a PGPR containing ACC deaminase with a plant seed or root

**Plant growth promoting
rhizobacteria (PGPR)**

**Two natural, non-pathogenic
strains of *Pseudomonas putida*
(UW3 and UW4)**

**One has high ACC Deaminase
One is an auxin producer**

**Both PGPR are applied to seeds
prior to planting**

Isolation

**Proliferation of
selected PGPR**

**Apply to seed,
Plant seeds**

Remediation Kinetics For Turner Valley Soil Greenhouse vs. Field

Turner Valley, Year 2 2006

June 8, 2006

July 28, 2006

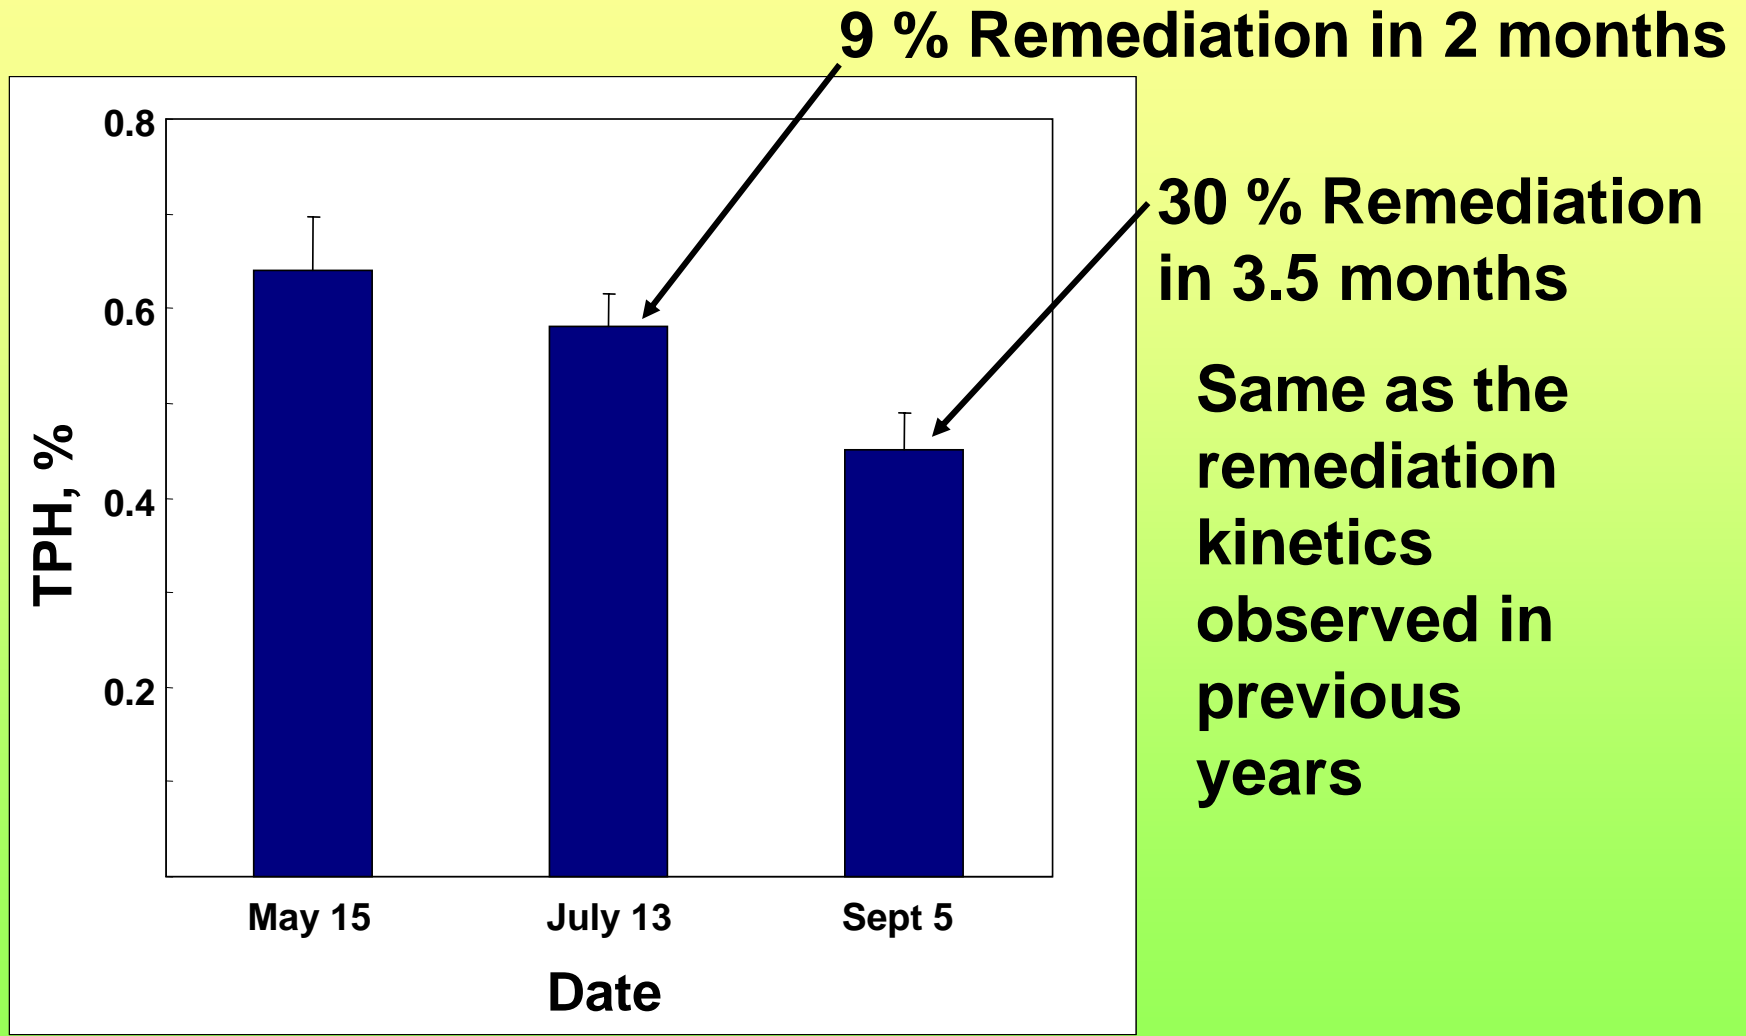

- Planted May 15, 2006
- Treated with seed treater
- UW3 + UW4 + Me-Celluose
- Good positive PGPR effect
- Excellent growth

Sept 5, 2006

Turner Valley, Year 2 Remediation

Turner Valley 2006 – 60 cm deep plot on clay pad - Planted May 15, 2006

June 8, 2006

+ PGPR

- PGPR

June 25, 2006

- PGPR

+ PGPR

July 28, 2006

+ PGPR

- PGPR

- Controlled experiment
- Test depth of remediation
- UW3 + UW4 + Me-Cellulose
- Spring ryegrass and tall fescue
- Plants have grown well
- Positive PGPR effect
- Remediation Sept 5:
15 % w/ PGPR, 6 % w/o PGPR

Field Test at Imperial Oil Land Farm, Sarnia, ON

Year 1: Summer 2004 – Rye grass

Oil Sludge Total Petroleum Hydrocarbon (TPH)

Contaminated Soil (15 % w/w)

MPPS (+ PGPR) **Plants alone (- PGPR)**

60 after planting

**Contaminants metab
and/or degraded:**

- ~75 g TPH/kg soil removed
- All fractions removed
- 100 g DW plants/kg soil.
- Plants cannot be 75 % TPH.

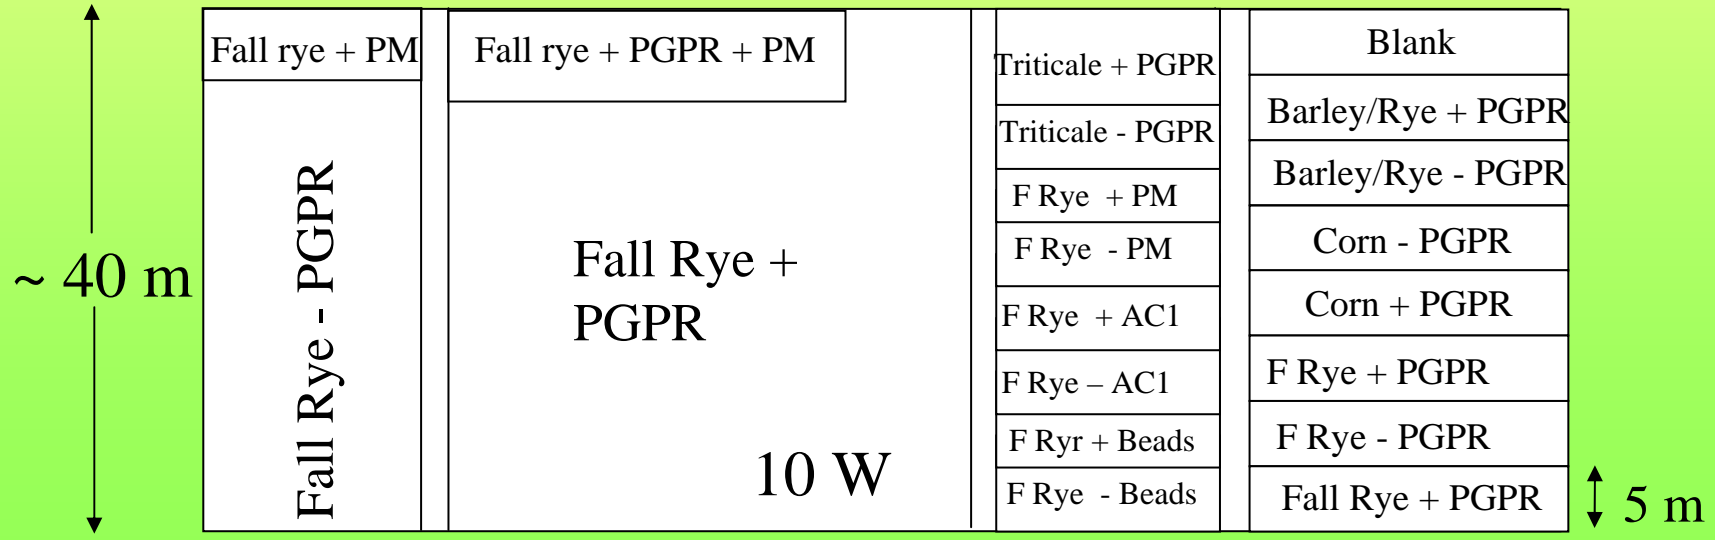

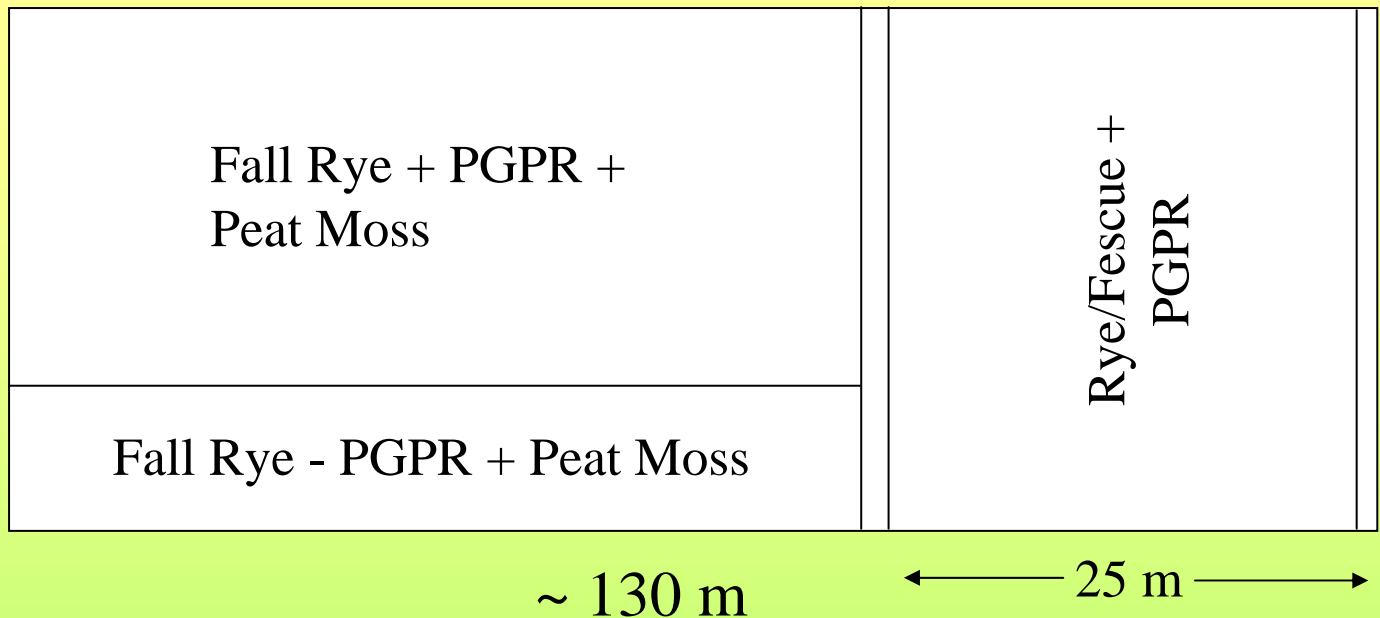

MPPS

Note: Summer 2004 was a cool wet summer

Remediation data on Aug 15: 13 % \pm 3%

HPLC assay for TPH uptake by Rye/Fescue roots

~ 35 % of the TPH removed from the soil

Root data rescaled; Qualitatively different HPLC profile

Remediated TPH does not appear in the roots

What happened to the TPH?

- TPH removed from the soil, but not in the plant roots
- TPH must have been degraded
- Where was it degraded?
- Perhaps in rhizosphere by bacteria, fungi and roots
- Soil fungi and bacteria have very active and diverse metabolic activities
- In soils with PGPR treated plants, bacteria and fungal counts are 5 to 10 fold higher

Possible degradation pathway of TPH in Soil

CONCLUSIONS

- **MPPS has great potential for efficient remediation of organic, salt and metal contaminated sites**
- **PGPR is the key: healthy plants with vigorous roots in PAH, TPH, DDT, salt and metal contam. soils**
- **PGPR alleviate stress and promote growth: Low ethylene and high auxin**
- **8 Months in the greenhouse: MPPS removed 90 % of recalcitrant TPHs and PAHs**
- **3 years of fields tests successful: MPPS removed 30 % to 60 % of recalcitrant TPHs and DDT per year**
- **Contaminants metabolized and/or degraded**
- **Great promise for restoration of oil and salt impacted sites, and brownfields**

Future Work

- **Continued field testing of the MPPS**
- **Increasing research on salt remediation**
- **Ready to deploy at new sites**
- **Proposals for new sites are being entertained**
- **TPH sites can be remediated in 2 to 4 years**
- **Further research on salt and metal remediation underway**

No PGPR

Remediation of Metals

The image shows three potted plants of the same species, likely a leafy vegetable, arranged in a row. The plants are in clear plastic pots filled with dark soil. The plant on the left, labeled 'Control', is the tallest and most lush, with many green leaves and a tall, thin stem. The plant in the middle, labeled 'Cu 1.0g/ kg + PGPR', is shorter and has fewer leaves than the control, but its leaves appear healthy and green. The plant on the right, labeled 'Cu 1.0g/ kg No PGPR', is the shortest and has the fewest leaves, indicating the most significant growth inhibition. A yellow plant marker is visible in the soil of the rightmost pot.

PGPR Effect on Plant Growth with 2% Salt in Irrigation Water

Dundas foundry soil – PAH contamination ~ 500 ppm

MPPS: germinated earlier and grew faster in the contaminated soil

MPPS (+ PGPR)

Plants alone (- PGPR)

Dundas Foundry: 30 d growth, MPPS has 300% more plant biomass in roots and shoots than plants alone

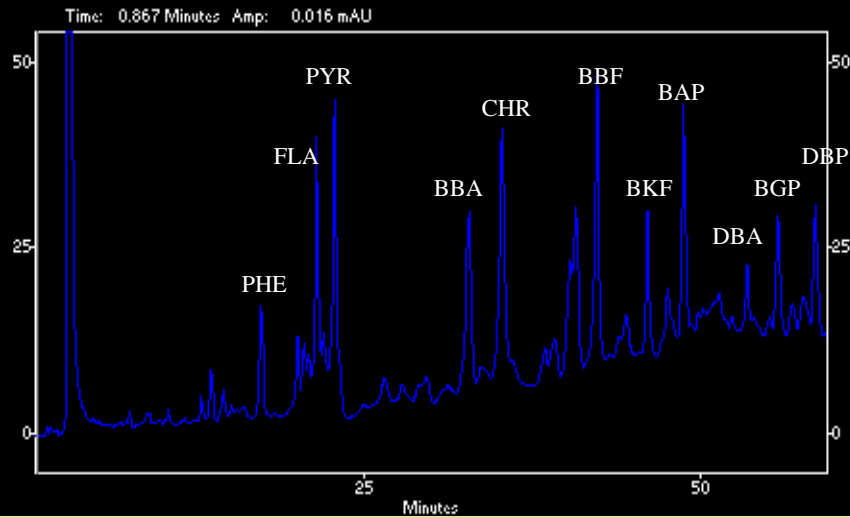

Plants alone (- PGPR)

MPPS (+ PGPR)

Effectiveness of the MPPS for Remediation From Dundas Foundry Soil: 90 days

Multi-Process System for Remediation of PAH Contaminated Brownfield: 90 d remediation leads to ~ 40 % removal of organics

Untreated brownfield soil

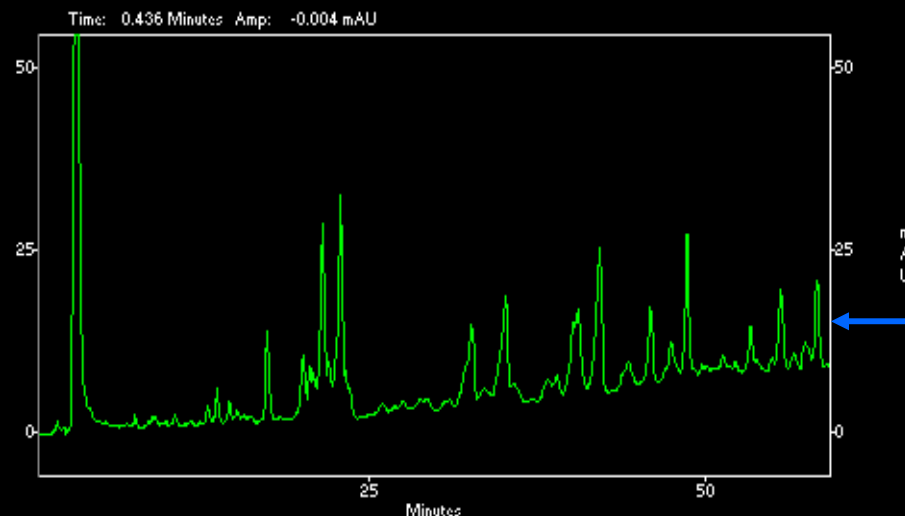

Bioremediation for 90 days

Phytoremediation for 90 days

MPPS for 90 days

DDT Remediation with Millet Summer 2005, Simcoe, ON

70 d growth

**+ PGPR
+ Peat Moss
w/PGPR**

**+ PGPR
- Peat Moss**

Remediation of DDT

- **Approximately a 0.5 Hectare site**
- **SW Ontario farmland**
- **Homogeneous levels of DDT at ~ 0.8 mg/kg (ppm)**
- **Half planted with Millet and half planted with fall rye**
- **40 % overall DDT remediation after 90 d**
- **DDT breakdown products (DDE or DDD) not found**
- **Chlorinated compounds can be degraded by phytoremediation**

Effect of PGPR on Plant Growth during Flooding or Drought Stress

Triticale/Barley Mix

Year 1: Summer 2005, North East, AB
~ 1 % TPH on a 7 Hectare site

- PGPR

+PGPR

70 d growth on good soil

Remediation of the NE Alberta Site

- A very large site: > 7 hectares
- Overall ~1 % TPH, with high variability in TPH levels (0.3 to 3 % TPH)
- 6 Hectares planted: Large scale pilot remediation; All plants (barley/fall rye mix, 2000 kg of seeds) were PGPR treated
- 1 Hectare was used as a random block test for PGPR efficacy. Barley, fall rye and triticale were used
- Pilot area: 15% to 30 % remediation was observed in 70 d
- Random block test (70 d), % remediation:

	<u>+ PGPR</u>	<u>- PGPR</u>
F3	2.8 ± 0.5	- 4.2 ± 0.7
F4	8.9 ± 1.3	1.9 ± 0.3
Total	21.9 ± 4.7	16.7 ± 2.3
F4G	32.6 ± 10.9	28.7 ± 5.3

- Consistent rates of remediation observed
- Evidence of PGPR improvement, PGPR impact on par with Turner Valley
- 2006 season: Planted only + PGPR Barly/Rye on June 20.

Multi-Process Phytoremediation System (MPPS)

- 1. Complicated mixtures of contaminants are present in the environment**
- 2. Many techniques based on an individual process failed or were ineffective**
- 3. Contaminants are too toxic to plants and bacteria for remediation**
- 4. Use and understanding of different remediation mechanisms**
- 5. Multiple remediation kinetics resulting in effective and efficient remediation**
