# 3D Conceptual Site Model Development using Electrical Resistivity Tomography (ERT) for Optimisation of Remedial Design

Steve Hardy - 2011 Remediation Technologies Symposium

## Case Study of Petroleum Hydrocarbon Impacted Site

- ▶ Site Overview
- ▶ Improved understanding of Site Conceptual Model using Electrical Resistivity Tomography (ERT)
- ▶ Application for remedial design and optimization

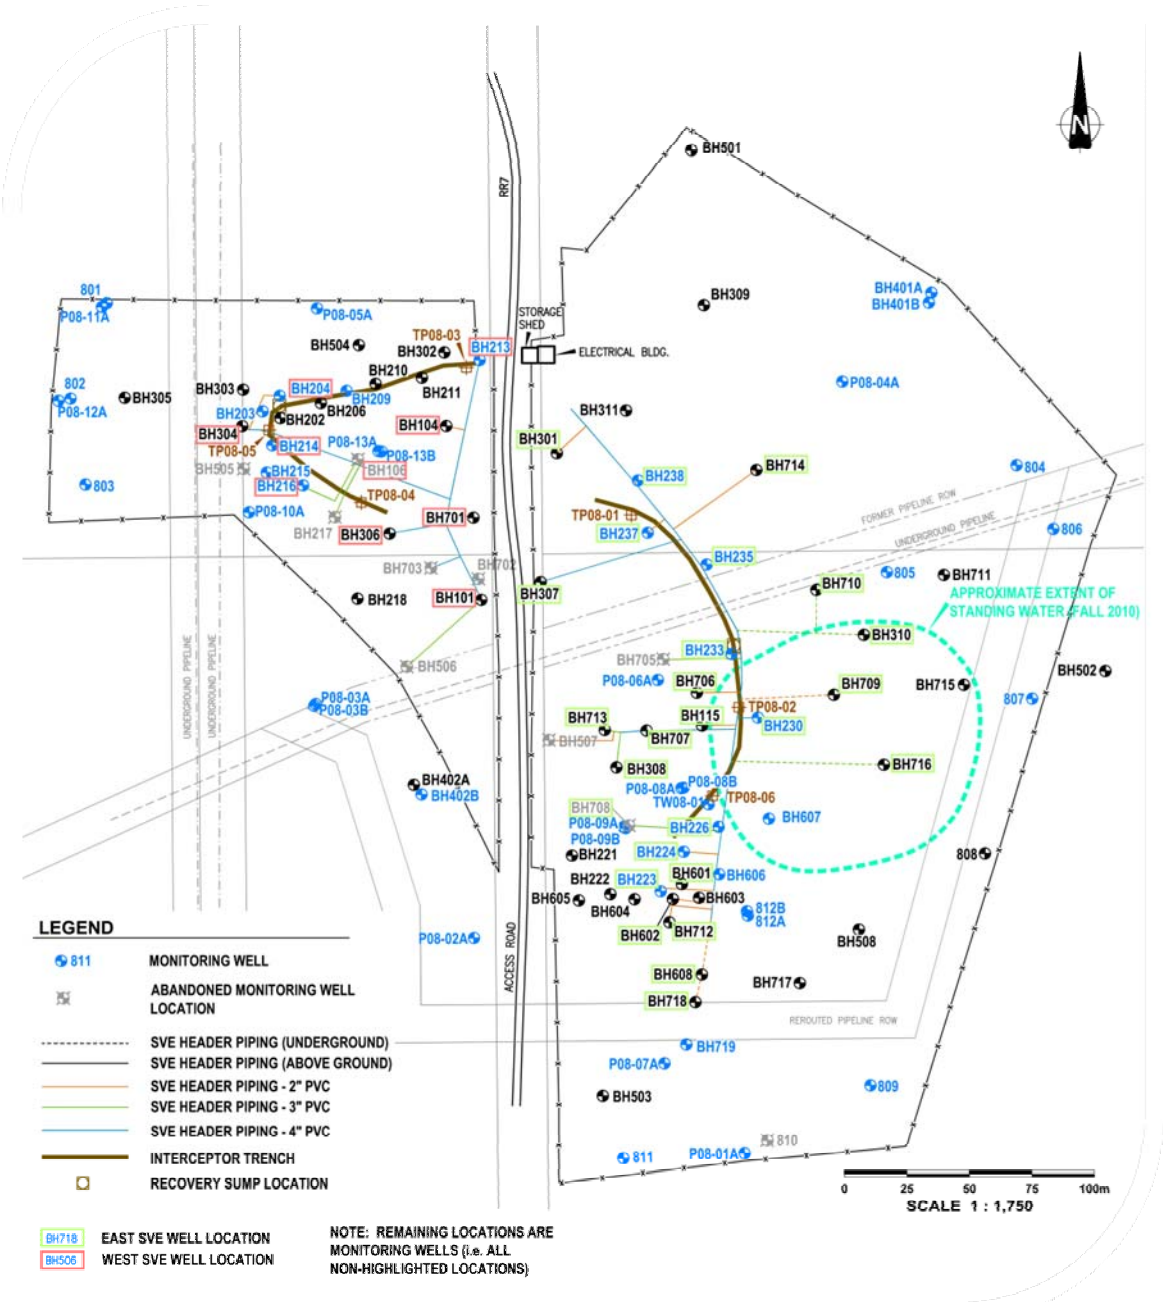

**WorleyParsons**

resources & energy

- ▶ 1998 Condensate Pipeline Release
- ▶ Initial Remediation:
  - groundwater recovery,
  - product recovery,
  - soil vapour recovery.

### Occurrence and Flow Controlled by:

- ▶ Local topography
- ▶ Interconnectivity of sand layers
- ▶ Groundwater fluctuations

- ▶ Groundwater elevations have increased at the site since initial remedial
- ▶ LNAPL likely entrapped below the groundwater surface

Interstate Technology Regulatory Council, 2010. LNAPL Training  
Part 1: An Improved Understanding of LNAPL Behaviour in the Subsurface

**WorleyParsons**

resources & energy

- ▶ Interpreted foot print of residual free-phase hydrocarbon liquids
- ▶ Dissolved and potentially free-phase product moving to south

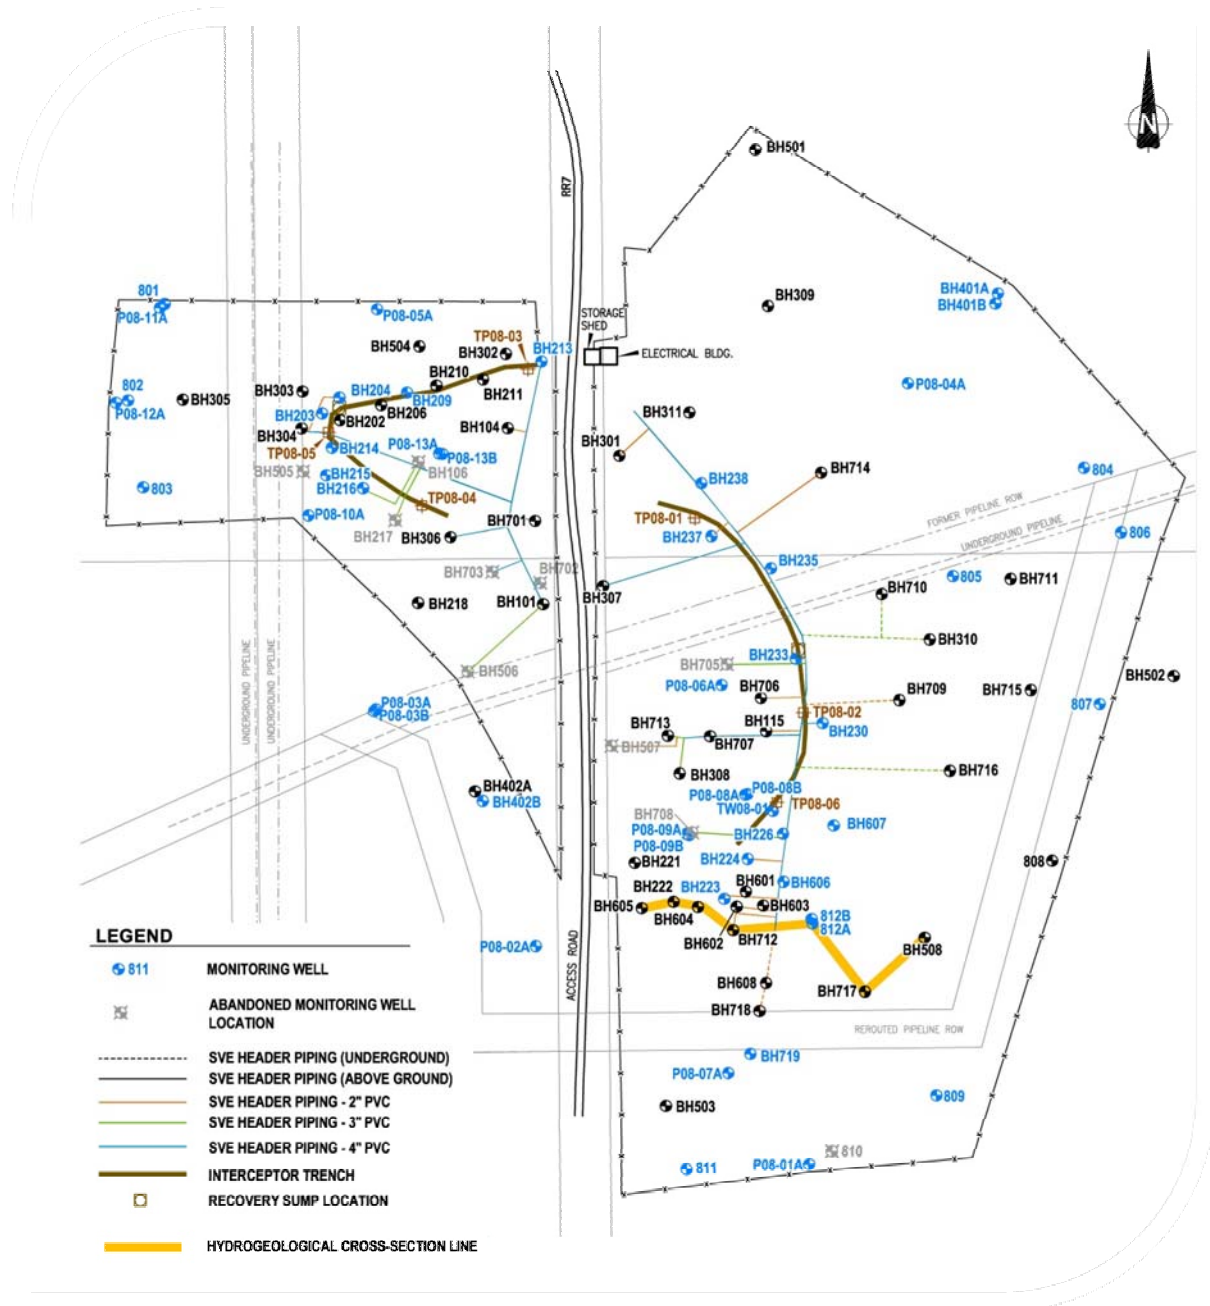

**WorleyParsons**

resources & energy

► Hydrogeological Cross Section

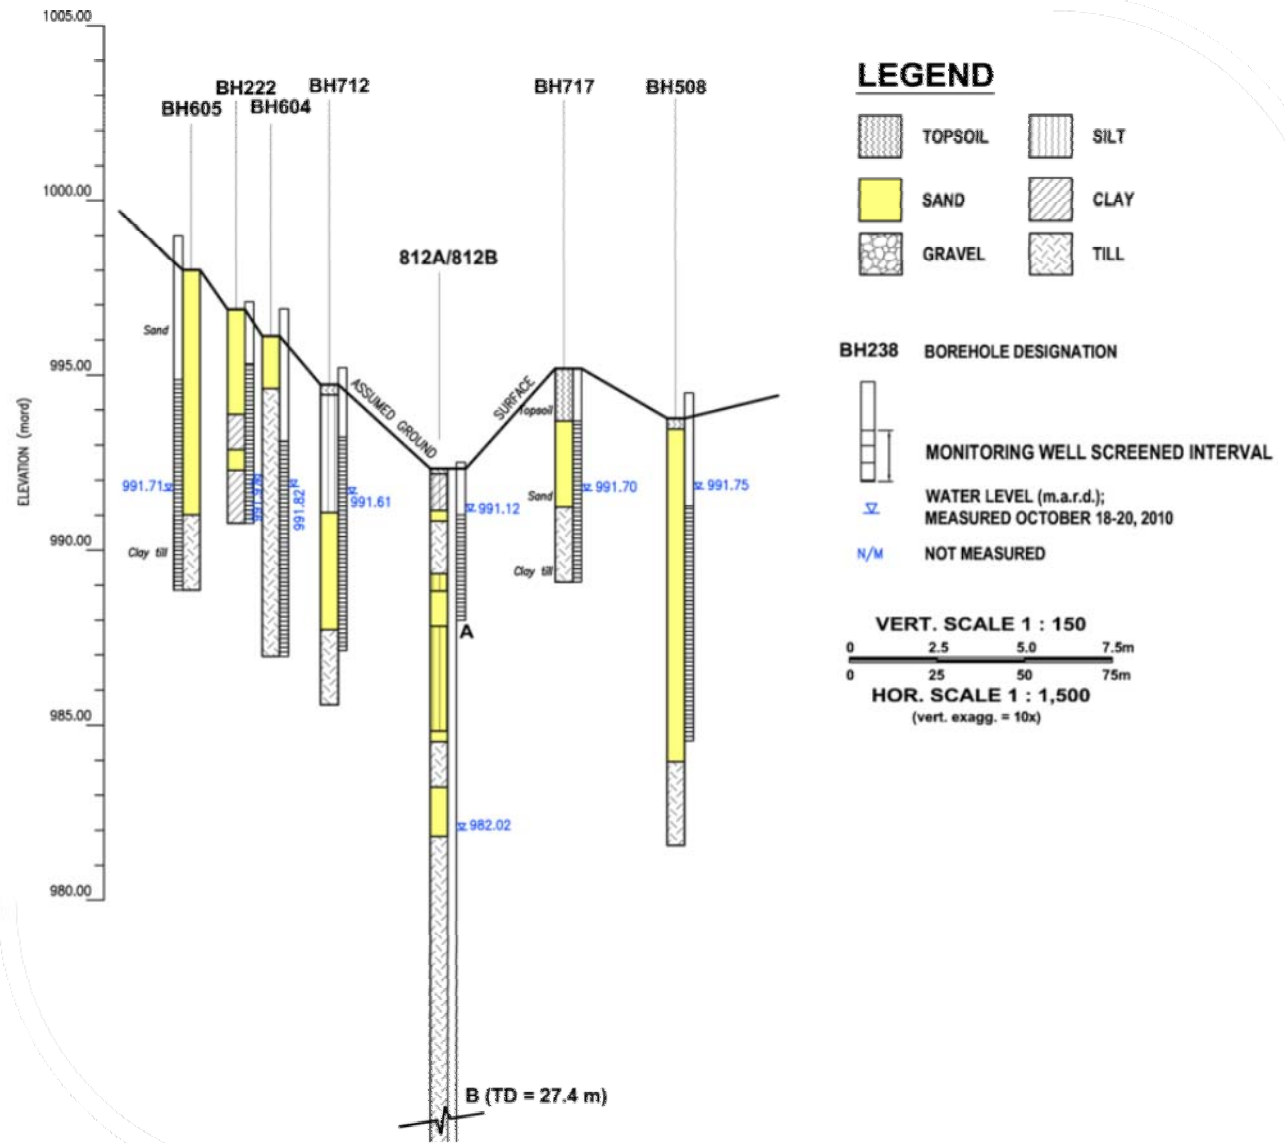

**WorleyParsons**

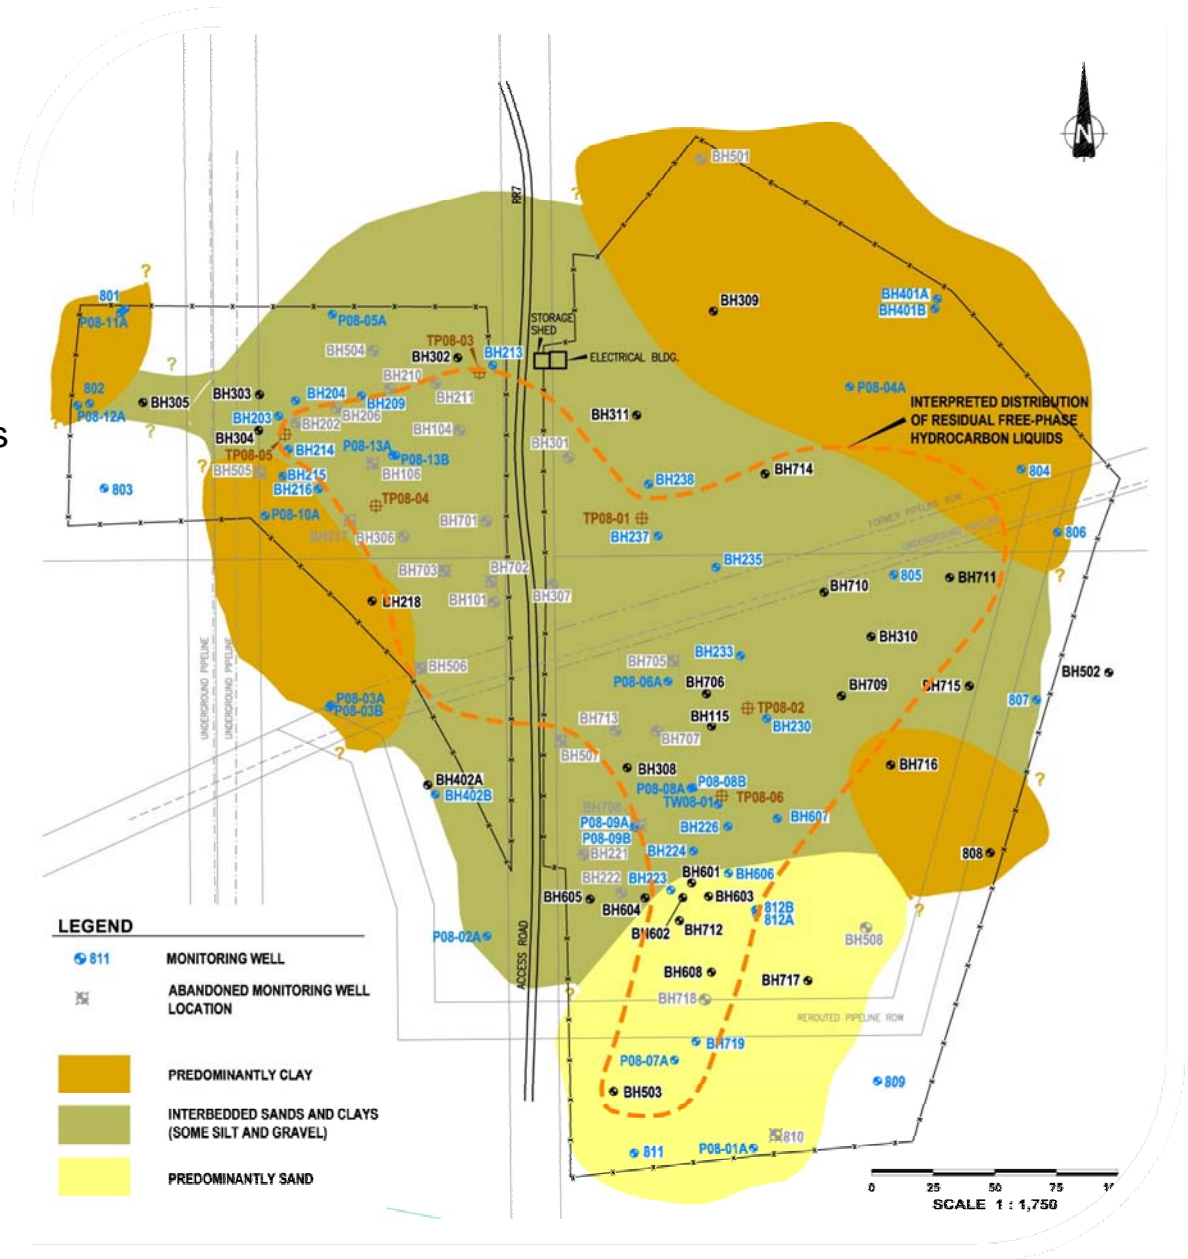

resources & energy

- ▶ Sand Content Variable
- ▶ How are units connected?

- ▶ Distribution of:
  - Sand;
  - Clay; and,
  - Interbedded sands and clay

- ▶ Many geophysical techniques used in environmental investigations are focused on mapping salt impacts based on variations in conductivity
- ▶ Clay has a higher conductivity than sand
- ▶ Electrical Resistivity Tomography (ERT) selected to map subsurface geology

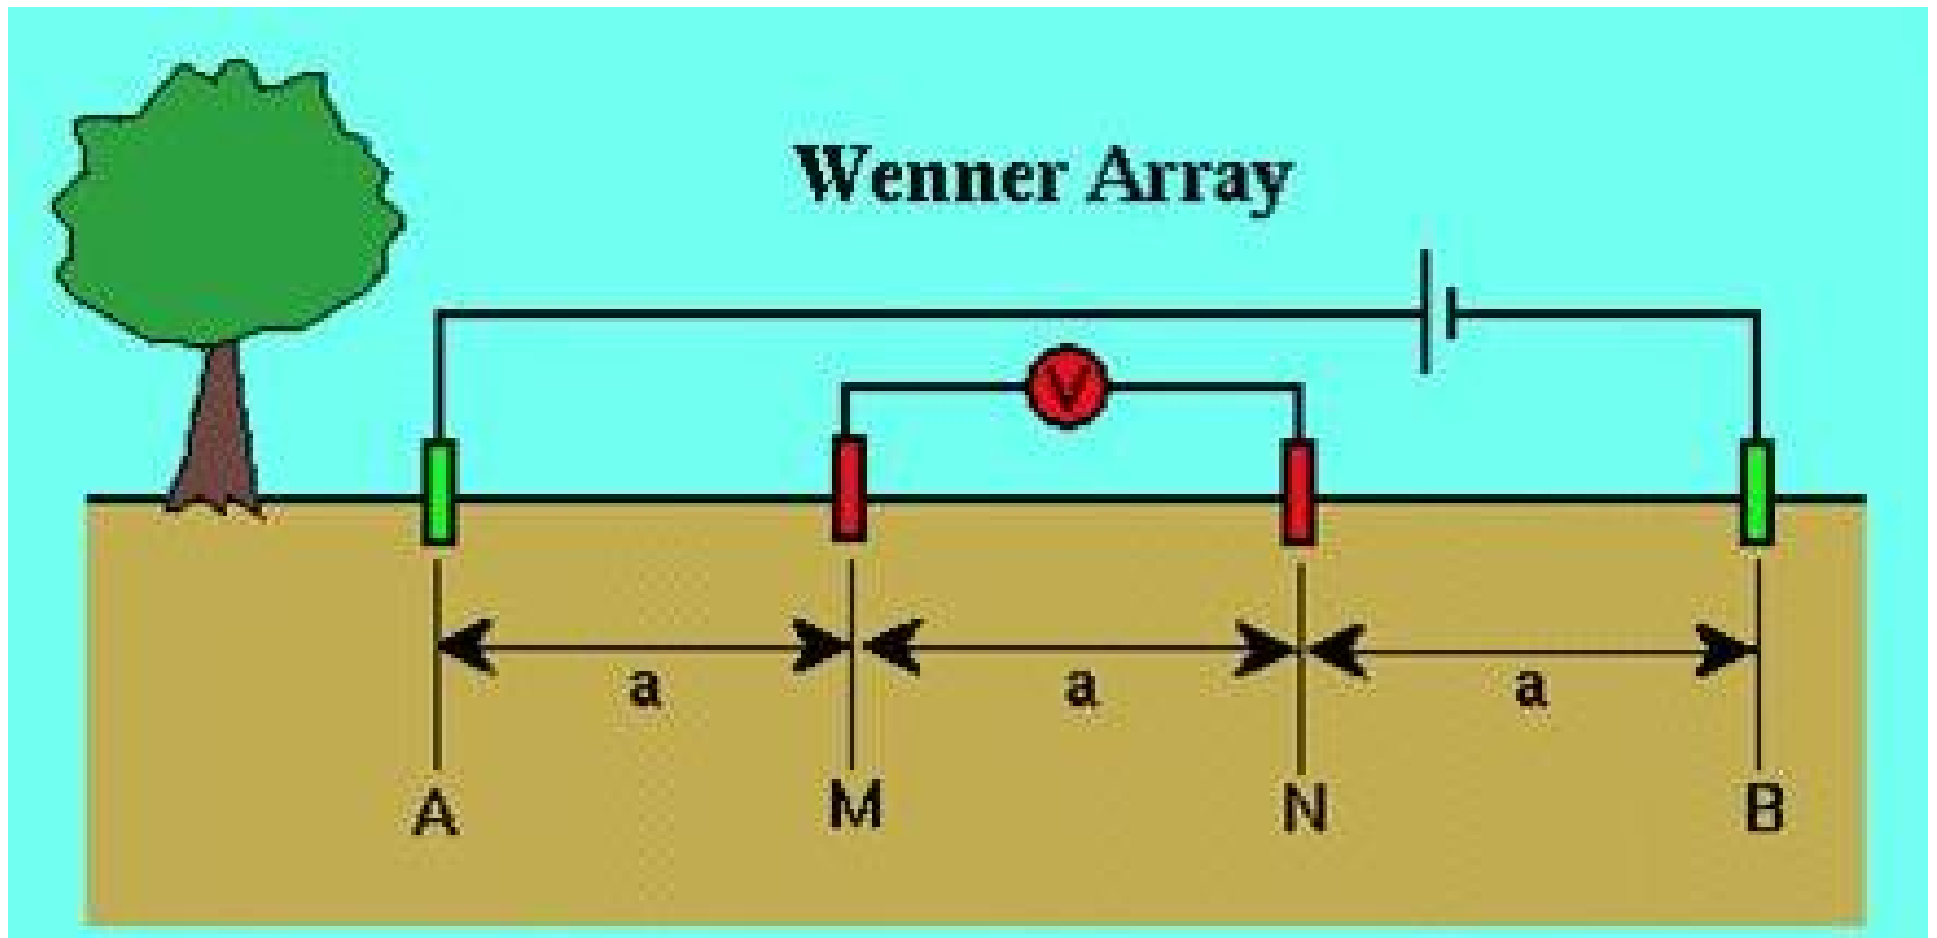

**WorleyParsons**

resources & energy

## ERT Set Up

**WorleyParsons**

resources & energy

## Data Distribution in ERT Survey

<u>Protocol</u>	<u>Array Type</u>	<u>Address File</u>	<u>Size .ORG</u>	<u>Size .UP/.DWN</u>
WENNER_L	Wenner- $\alpha$	LONG	258	113
WENNER_S	Wenner- $\alpha$	SHORT	87	50
Sum			345	163

### WENNER PSEUDOSECTION

- ▶ Subsurface Resistivity at Line IP0903
- ▶ Warmer colours (i.e. red and pink) indicate areas of higher resistivity
- ▶ Cooler colours (i.e. blue) indicate low resistivity

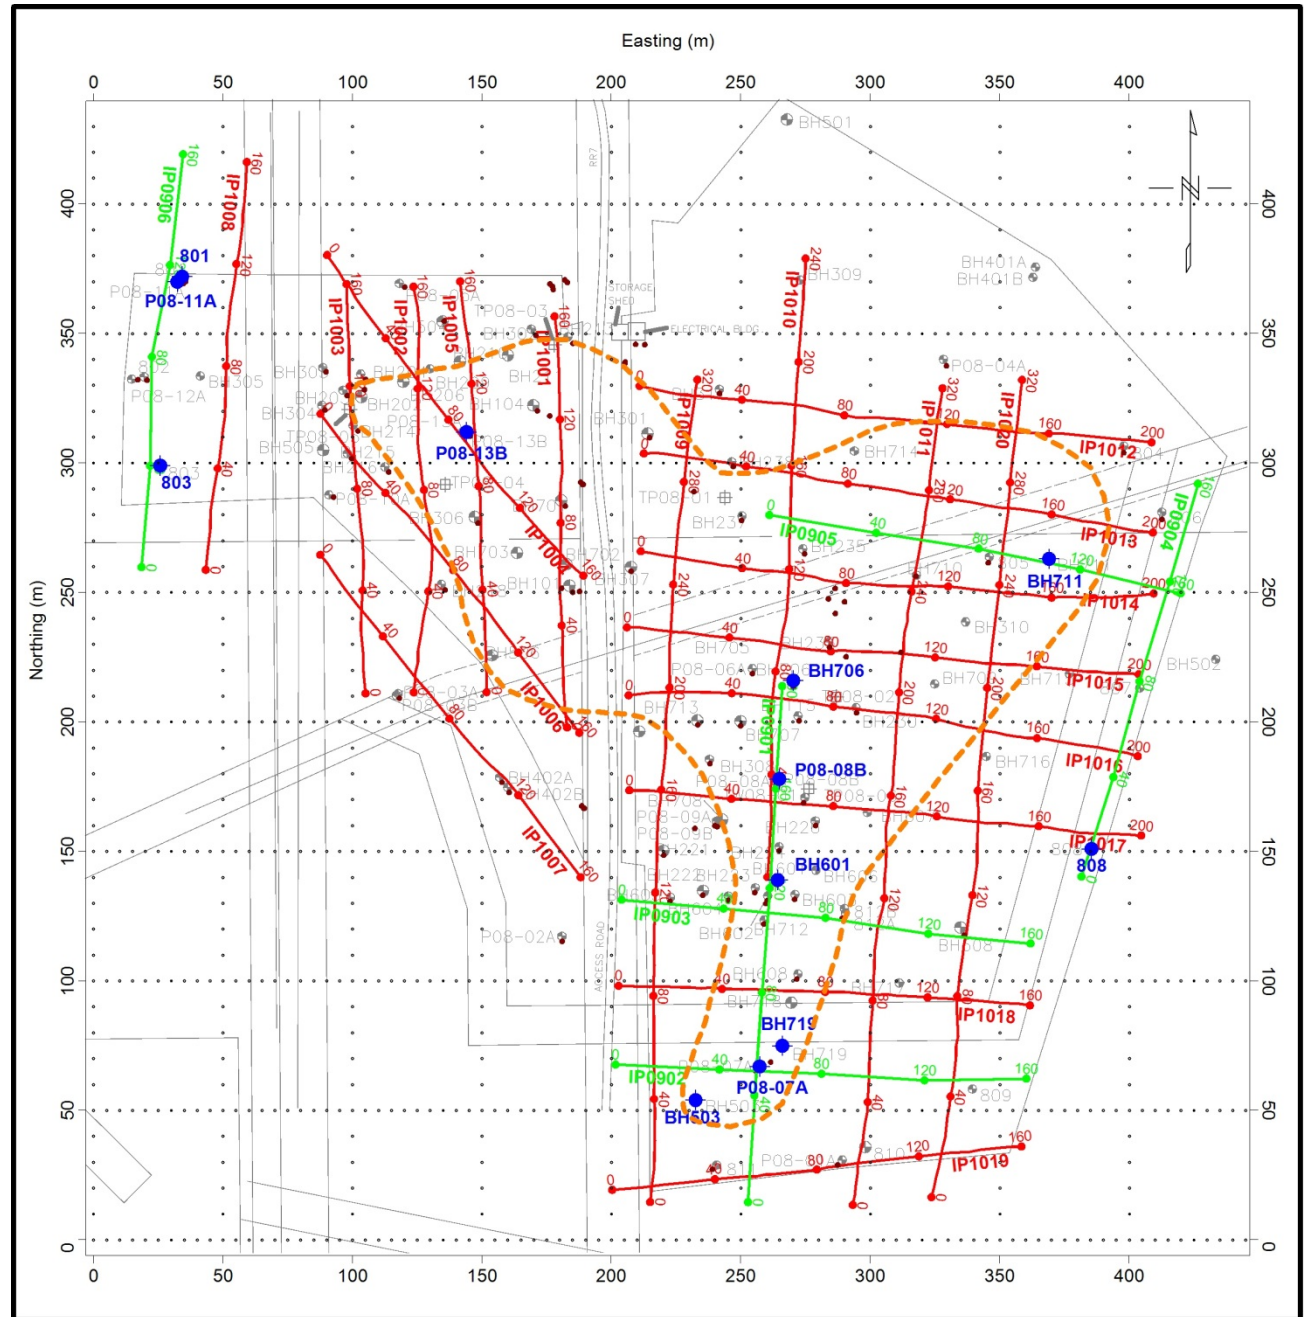

**WorleyParsons**

resources & energy

- ▶ Twenty-six ERT survey lines
- ▶ Lines range from 160 to 320 m in length

### 3-D Model View

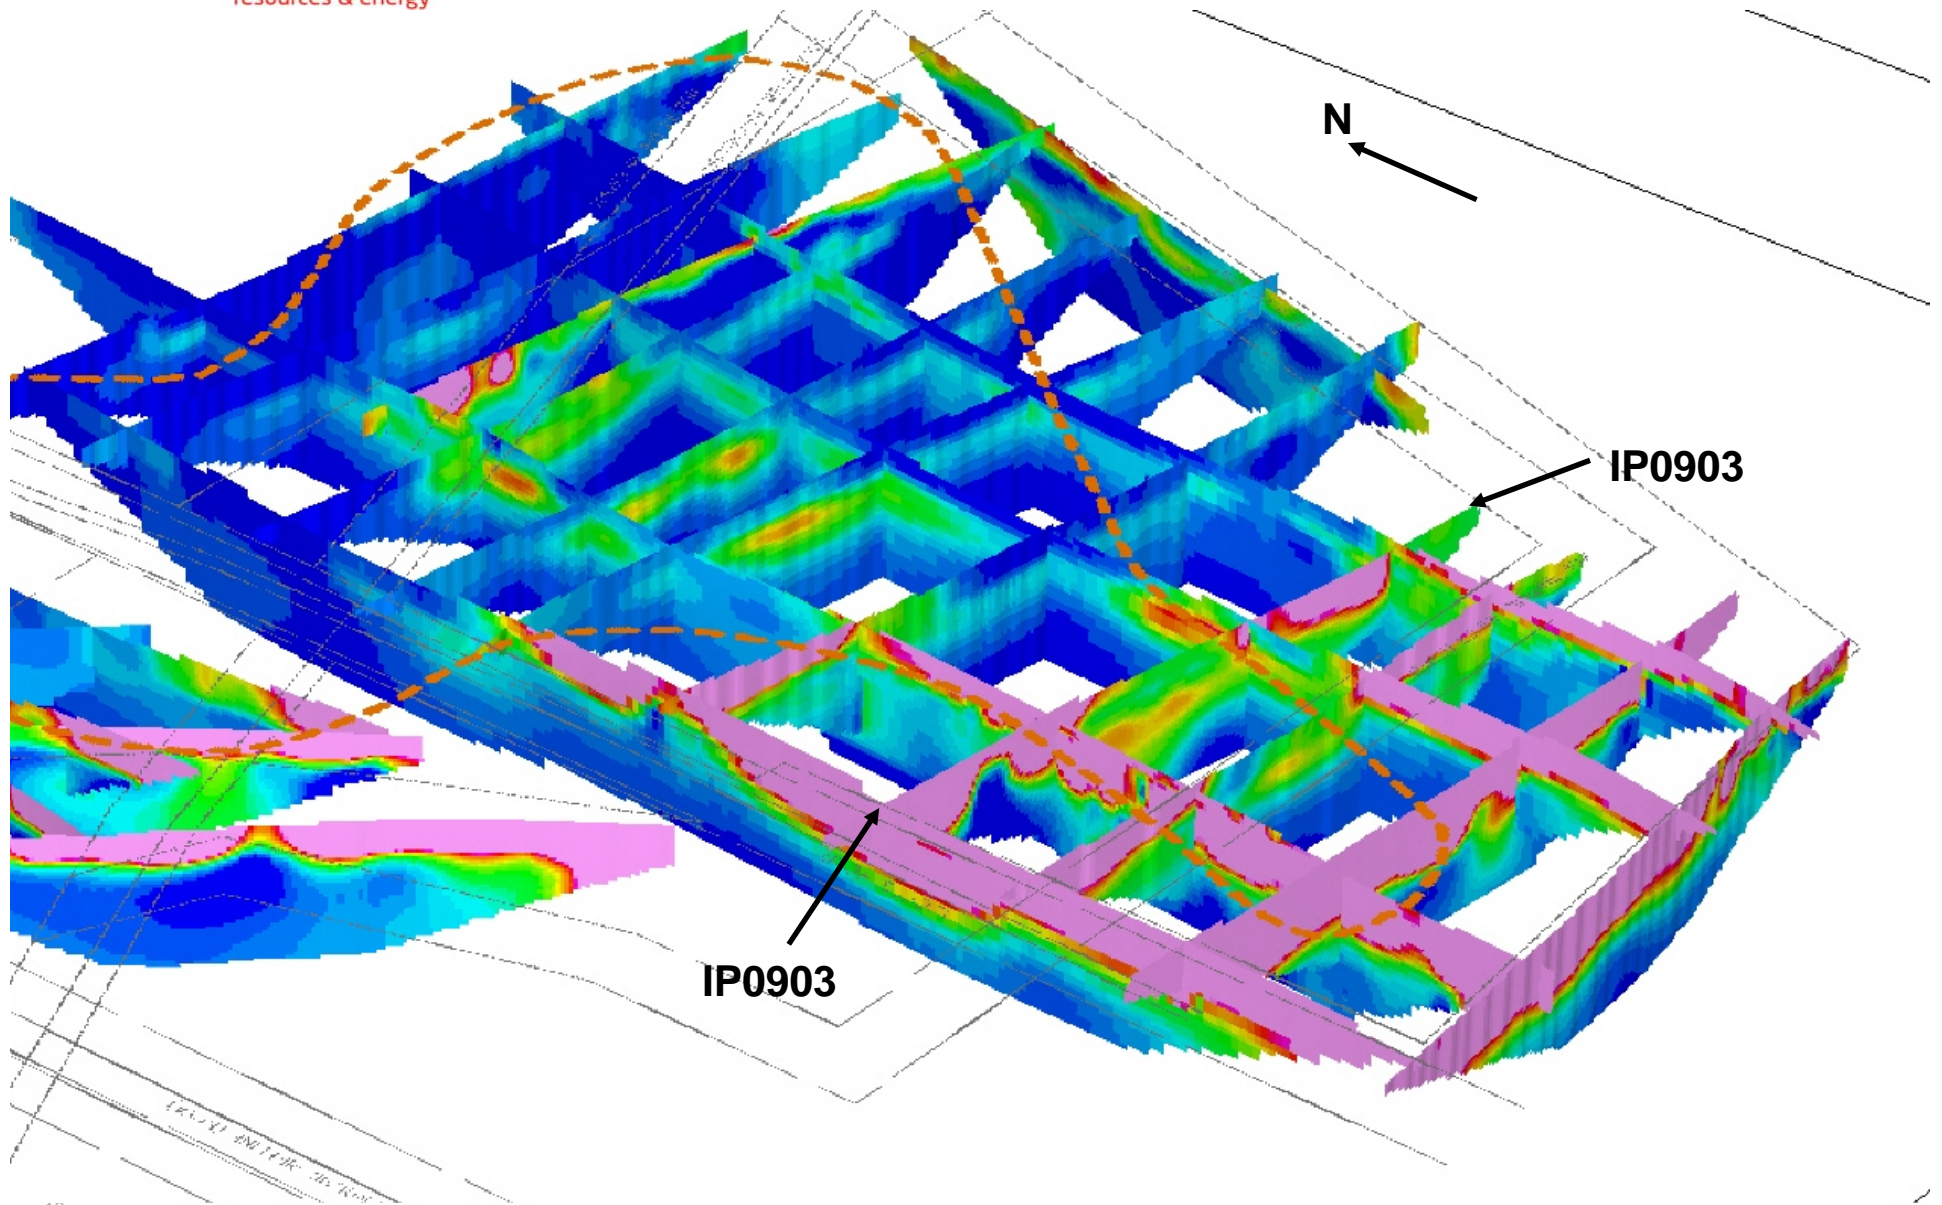

**WorleyParsons**

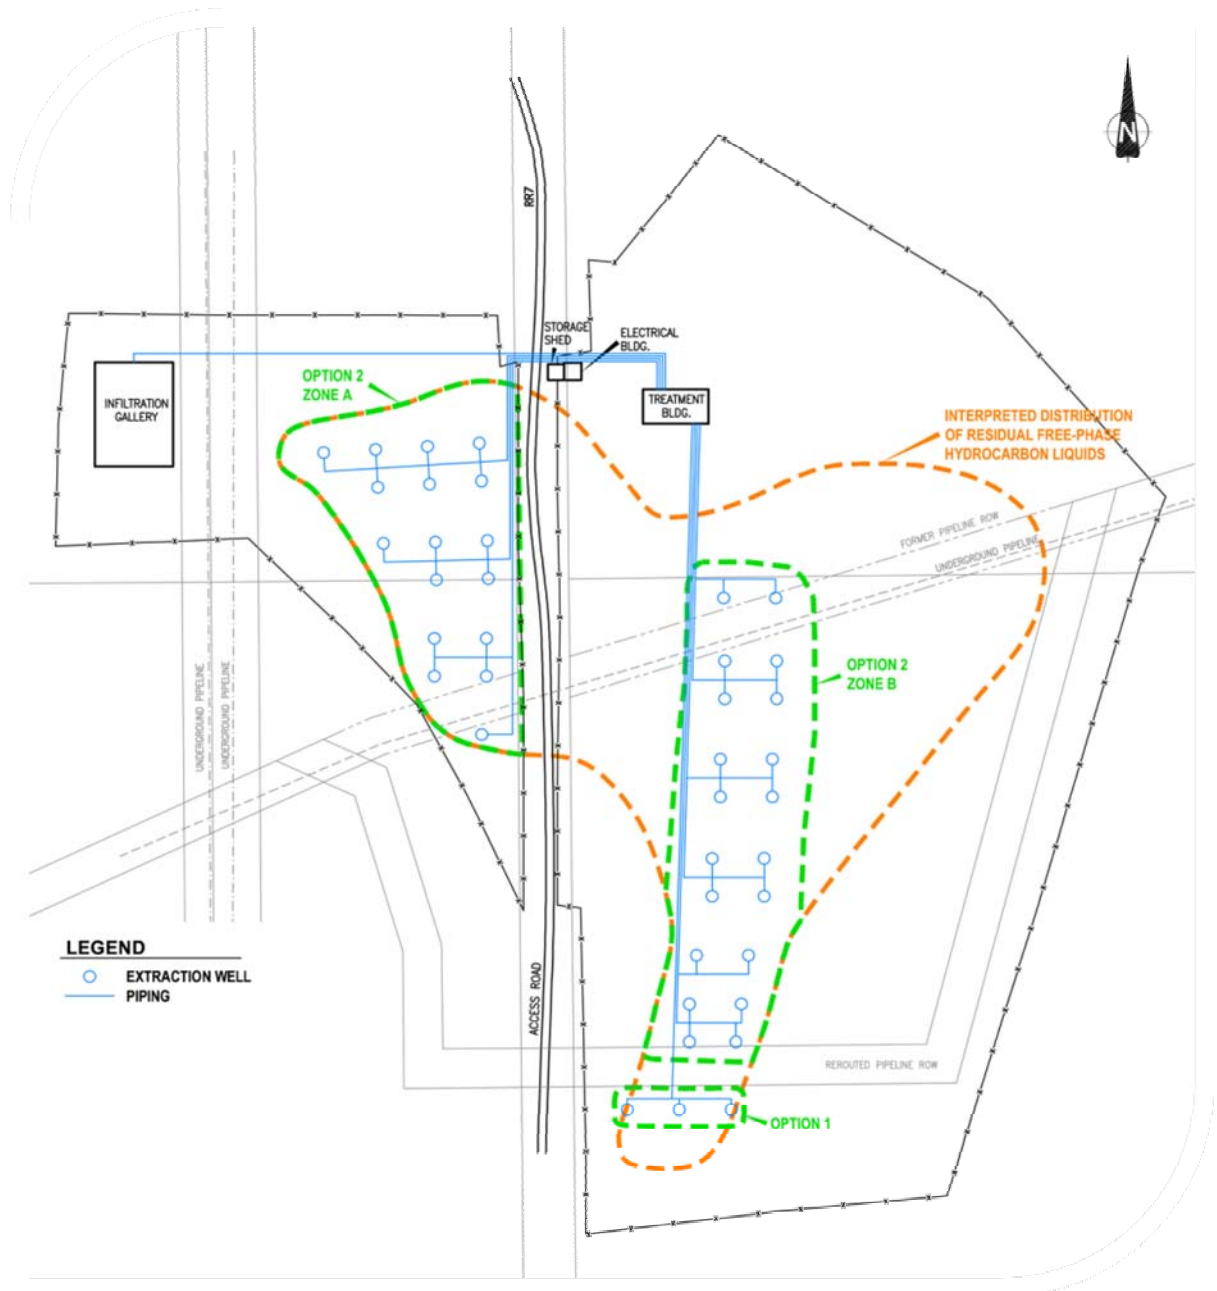

resources & energy

### 3-D Model View

- ▶ Conceptual Design
  - Remediation Targets
