

PlumeStop™

COLLOIDAL BIOMATRIX

securing rapid risk reduction and accelerated bioremediation
using a dispersive injectable reagent

PlumeStop™ Colloidal Biomatrix

- What it is and how it works
- Performance in the lab
- Performance in the field
- Usage

PlumeStop™ – what it is

“A highly dispersive, injectable *sorbent* and *microbial growth matrix*”

- Colloidal activated carbon (1 – 2 μm)
 - Size of a bacterium – suspends as ‘liquid’
 - Huge surface area – extremely fast sorption/concentration reductions
- Anti-clumping / distribution supporting surface treatment (patent applied for)
 - Enables wide-area distribution through the soil matrix
- Low-solubility / controlled availability matrix nutrients
 - Support in-matrix contaminant biodegradation
 - Does not impact groundwater

PlumeStop™ Colloidal Biomatrix

- BioMatrix
 - Soil-surface network
 - Host to bacteria
 - Close contact with sorbed contaminant
 - Couples with Aerobic, Anaerobic, or MNA
- Contaminants Treated
 - Petroleum Hydrocarbons (TPH, BTEX, etc)
 - CVOCs including ethenes and ethanes
 - MTBE, pesticides, and more

PlumeStop™ – how it works

- Wide subsurface dispersion
 - Simple application
 - Ability to address restricted access areas, deep plumes, etc.
- Sorbs contaminants rapidly
 - Rapid concentration reductions (multiple OOM days to weeks)
- Accelerates biodegradation
- Long-term efficacy

Critical Questions for the Technology

- Can it effectively distribute in situ?
- How effective is contaminant sorption?
- What happens to sorbed contaminants?
- How does it perform in the field?

PlumeStop™: sorption capacity

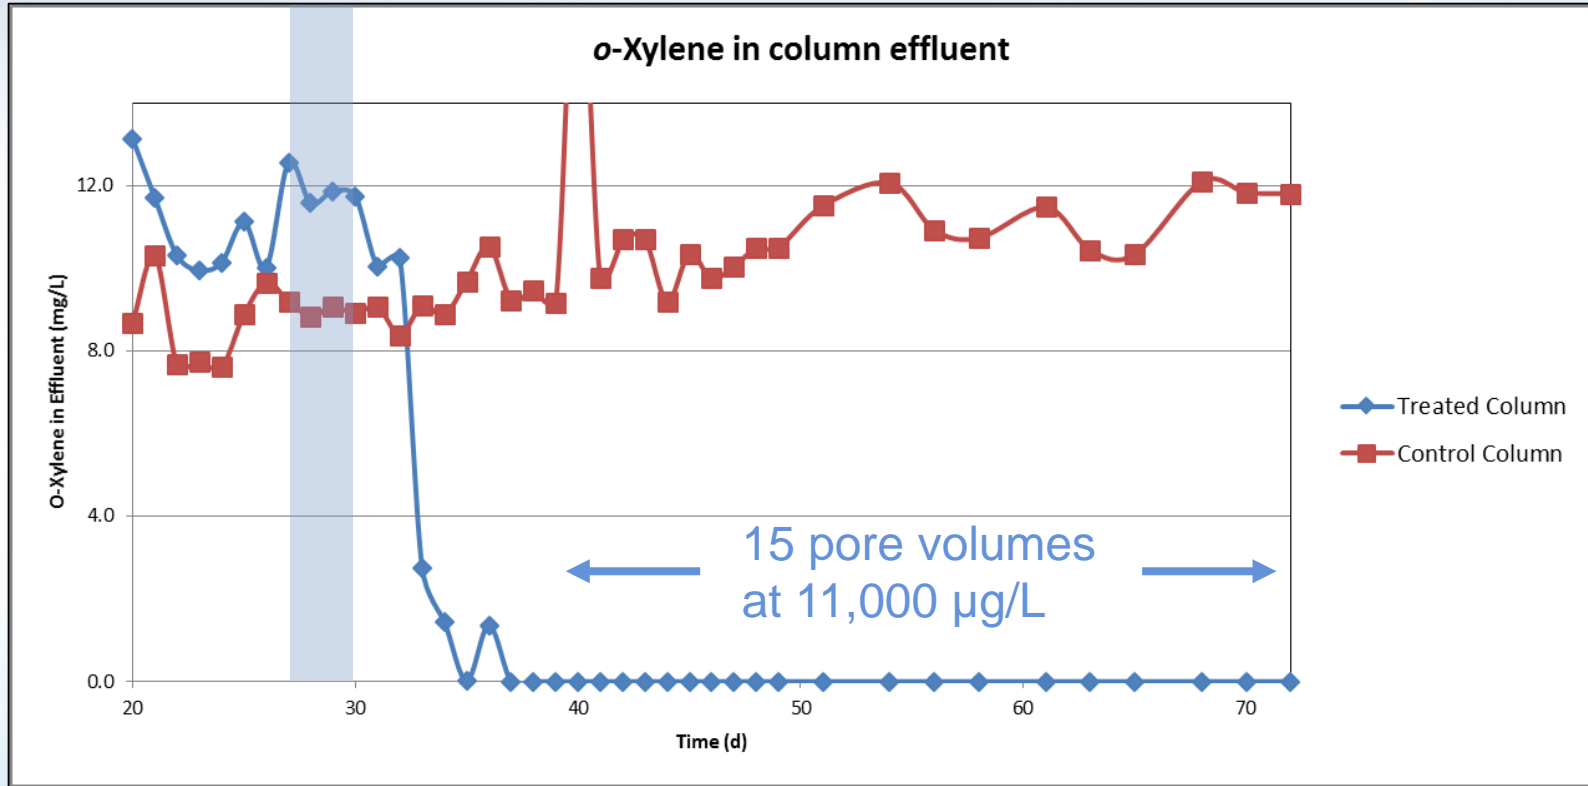

Q: Does the treatment to secure distribution negatively affect sorption capacity?

Column Study

1. Feed ~10 mg/L *o*-xylene by blending water and saturated xylene in-line
2. Monitor both column effluents daily
3. Feed plume stop dose into “treated” column
4. Continue xylene feed on both
5. Continue daily monitoring

PlumeStop™: Sorption Capacity

PlumeStop™: post-sorption biodegradation

Q: Does biodegradation proceed post-sorption?

Benzene Degradation Batch-Equilibrium Study

- Soil-water slurry microcosms
 - Treatment 1: **with PlumeStop (live)**
 - Treatment 2: **with PlumeStop (sterile)**
 - Treatment 3: **no PlumeStop (sterile)**
- Sampled destructively in triplicate
 - Days 1, 7, 14, 21
- **Water concentration** monitored by head-space analysis
- **Total benzene mass** monitored by whole-system extraction

PlumeStop™: post-sorption biodegradation

Aqueous Benzene by Headspace Analysis

PlumeStop™: post-sorption biodegradation

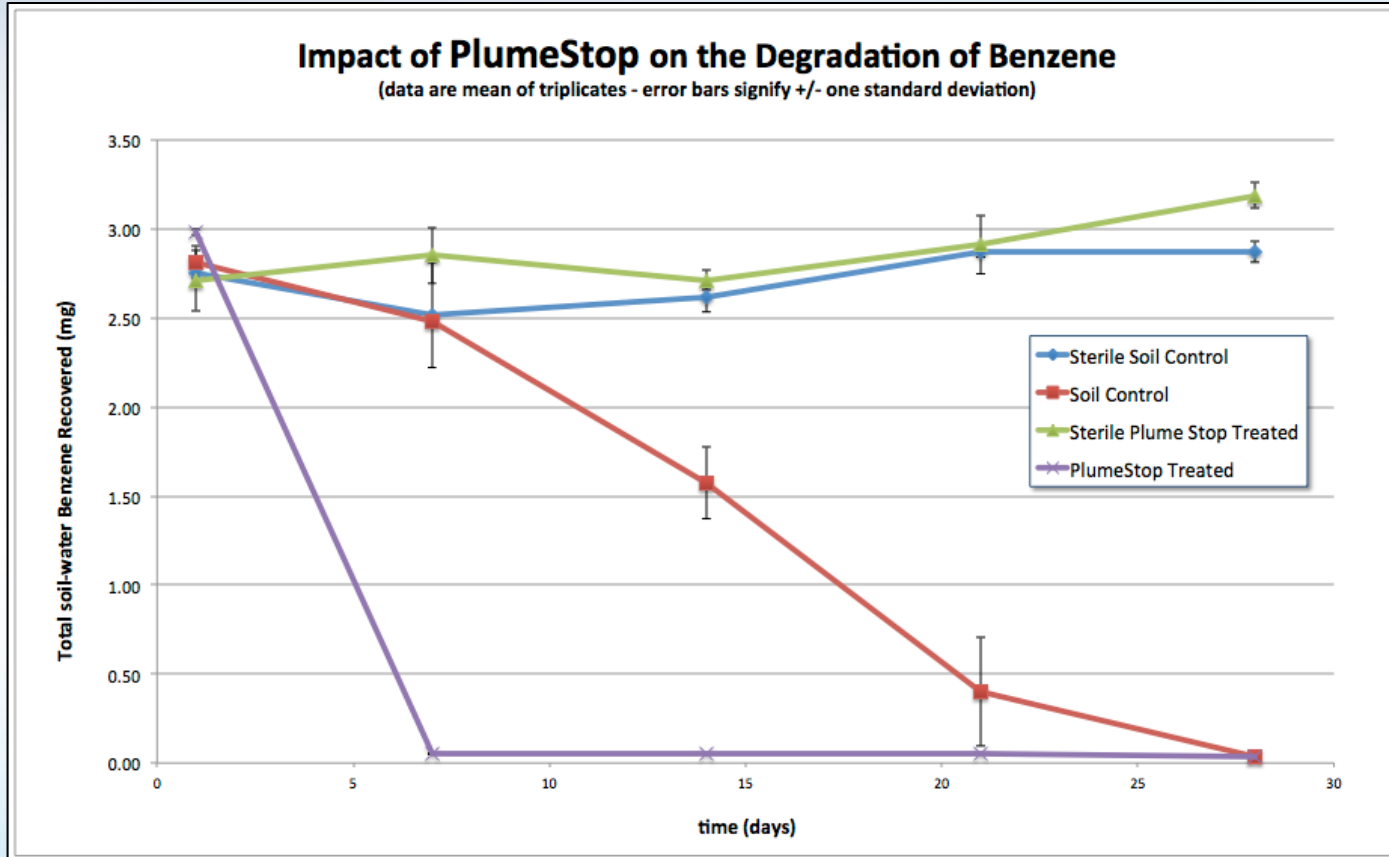

Q: Is net contaminant degradation rate enhanced, inhibited or unaffected by sorption into the biomatrix?

Benzene Degradation Batch-Equilibrium Study #2

- Soil-water slurry microcosms
 - Treatment 1: **with PlumeStop (live)**
 - Treatment 2: **with PlumeStop (sterile)**
 - Treatment 3: **no PlumeStop (sterile)**
 - Treatment 4: **no PlumeStop (live)**
- Sampled destructively in triplicate
 - Days 1, 7, 14, 21, 28
- Whole-system extraction
