

# Using Lessons from Chronic Pollution Disturbance to Develop New Marine Ecological Monitoring Tools to Allow Rapid Assessment under Emergency Spill Response

Dr. Shannon Mala Bard Practice Leader, Biological Risk Assessment & Science and Innovation  
Hemmera, an Ausenco Company

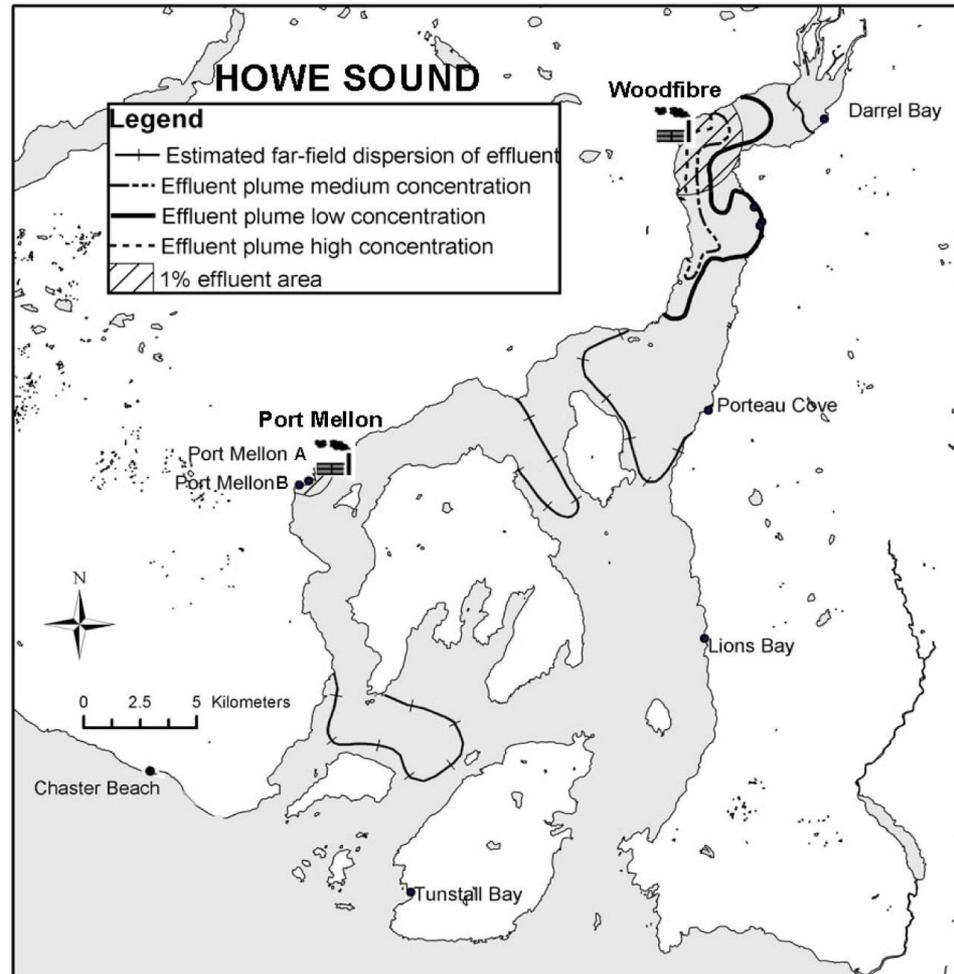

Aaron Eger & Dr. Julia Baum,  
Department of Biology, University of Victoria

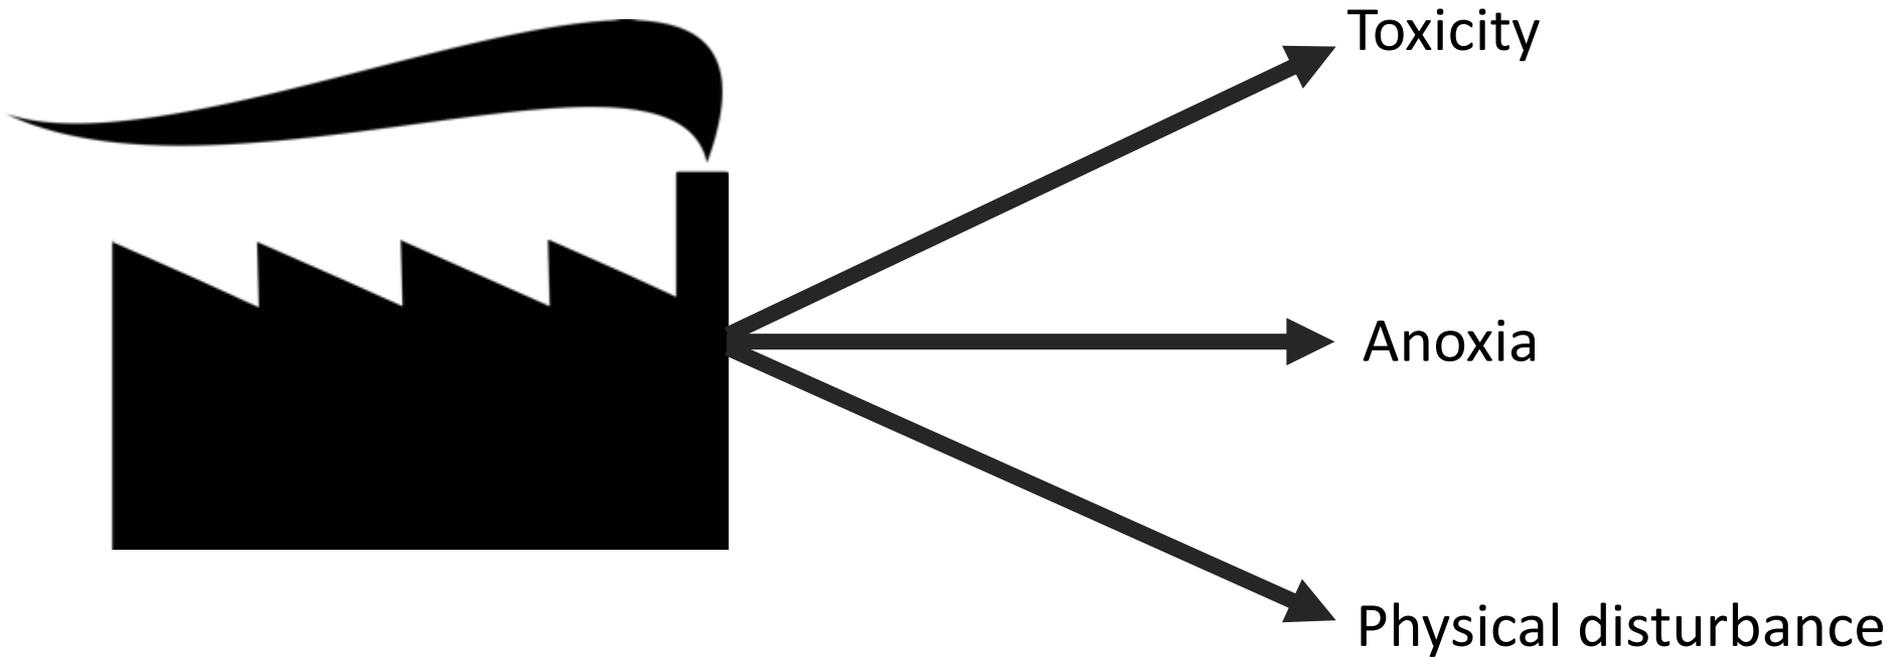

# CSI Coastal Scene Investigation

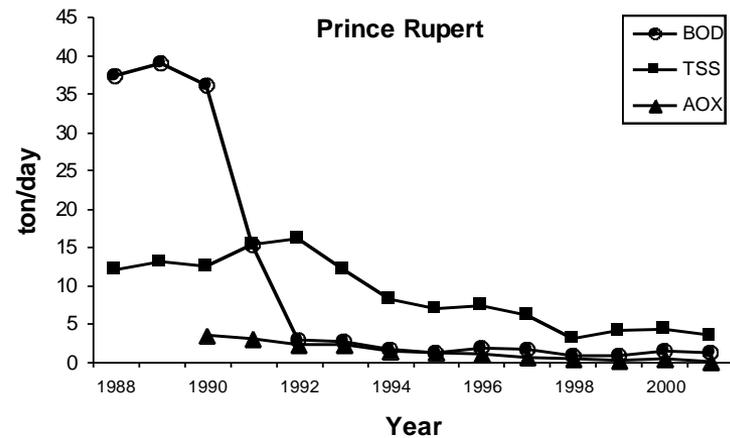

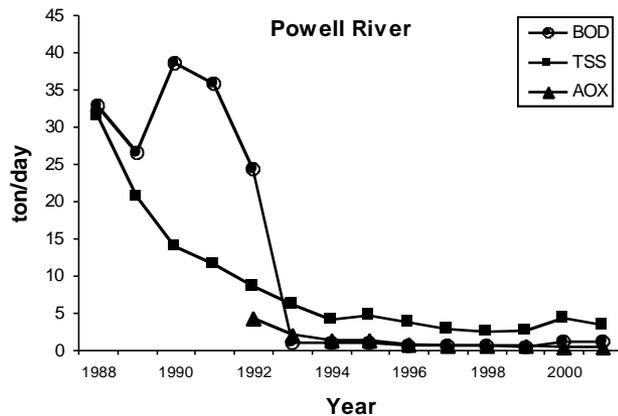

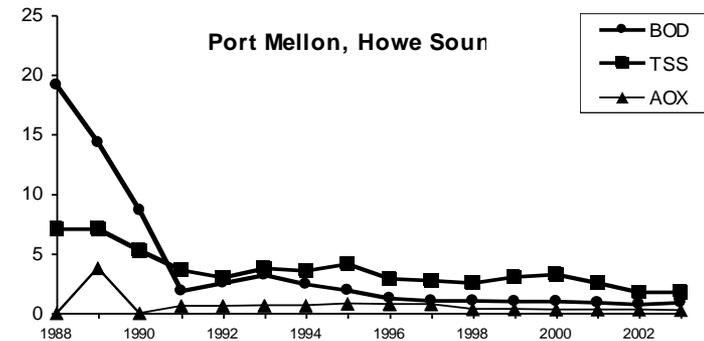

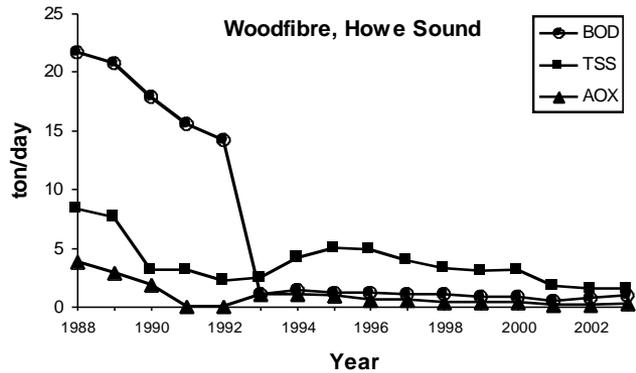

# Sites selected along pollution gradient

# Pulp and paper pollution

# Improvements in Effluent Quality since EEM

Data kindly provided by Environment Canada and Hatfield Consultants, 2004

# Economic shutdowns

- **Prince Rupert mill closed 2001**
- **Woodfibre mill closed 2006**
- **Powell River, closure of 1 of 2 historic mills**

# Intertidal Quadrat Studies- faunal data

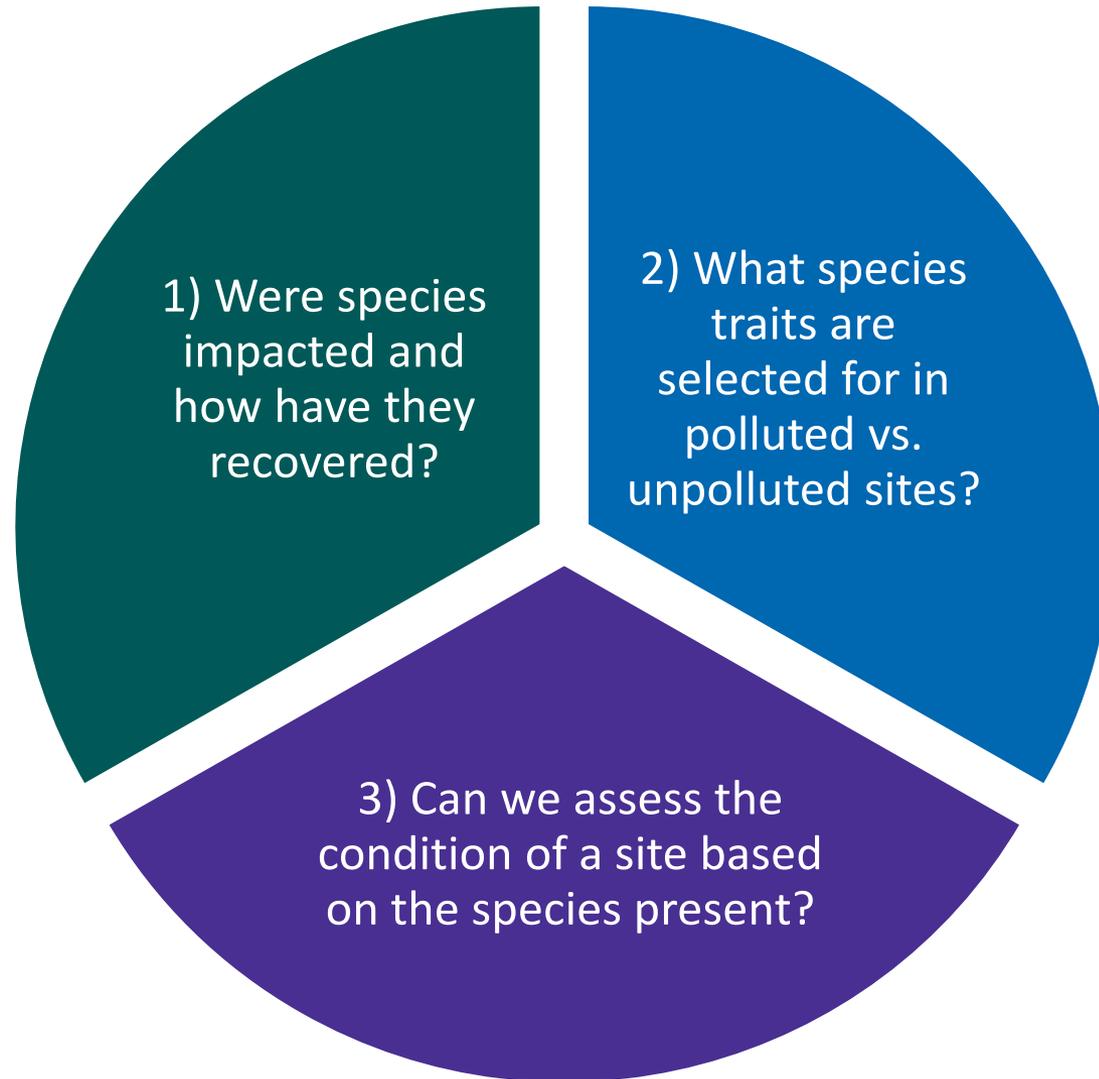

**Percent (%) Cover**

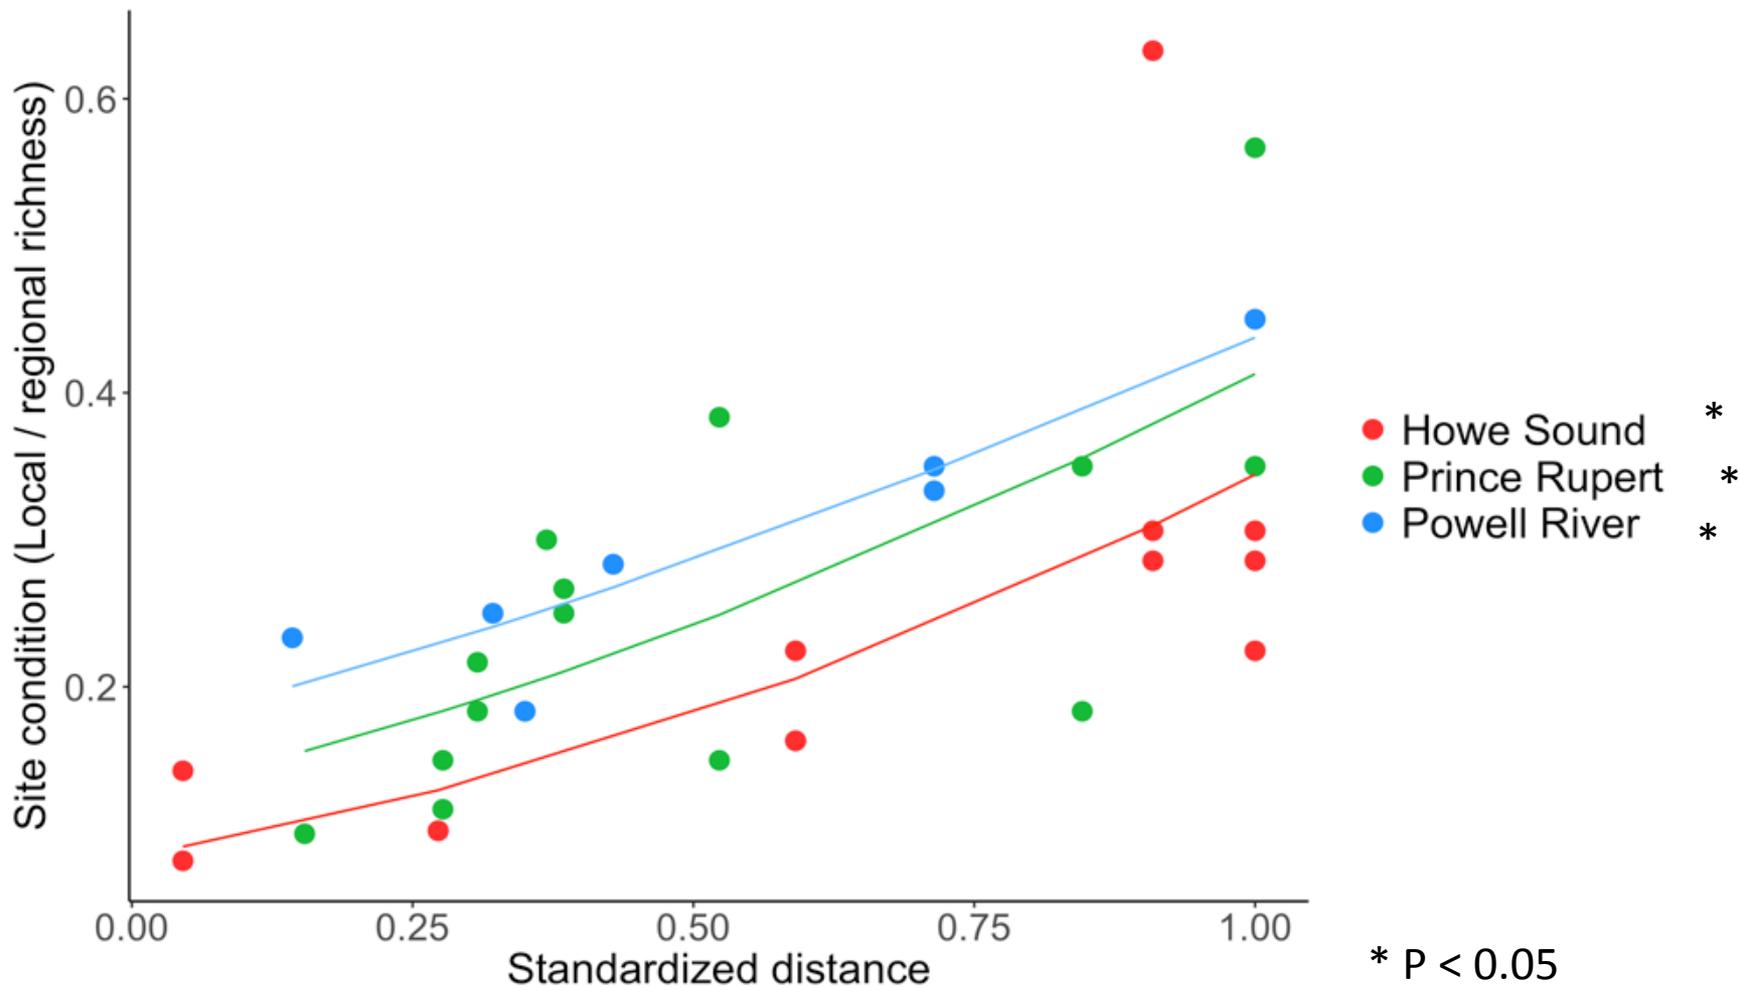

**Under-rock Species Diversity**

# Questions

# Q1: Initial impact - 1990s

# High Exposure: Port Mellon

# Moderately Exposed Bowen Is. 20

# Reference Site

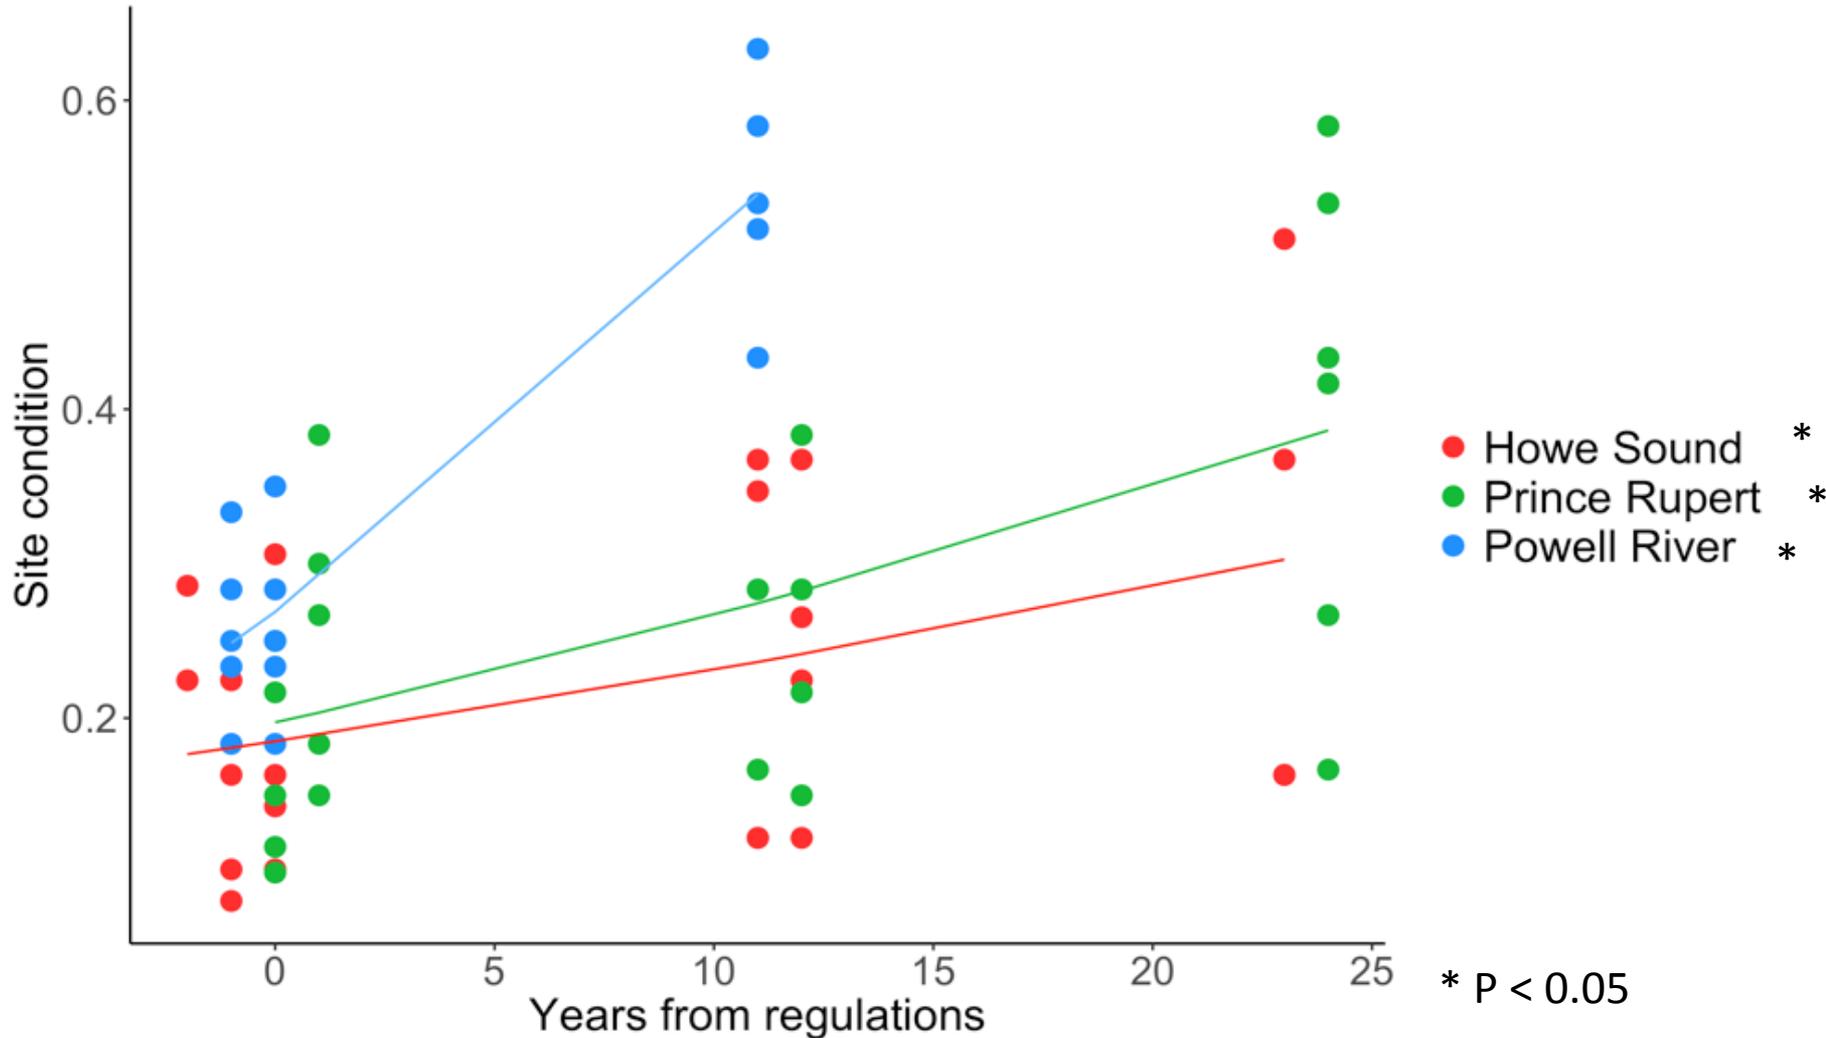

bryozoan

Red  
sponge

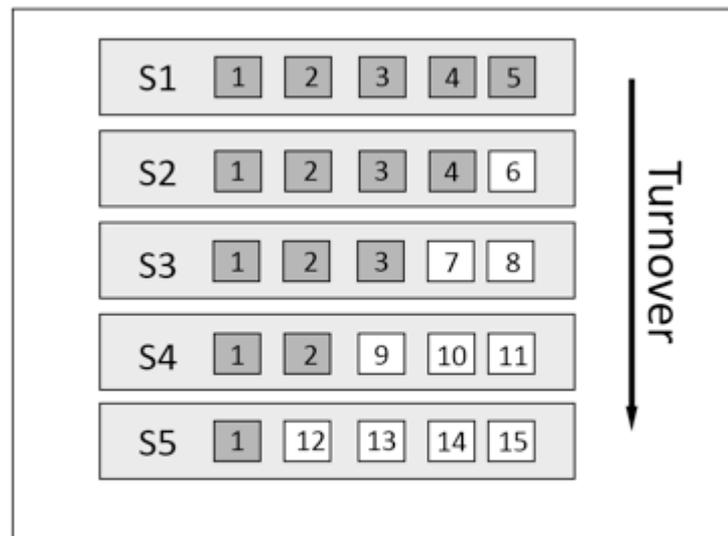

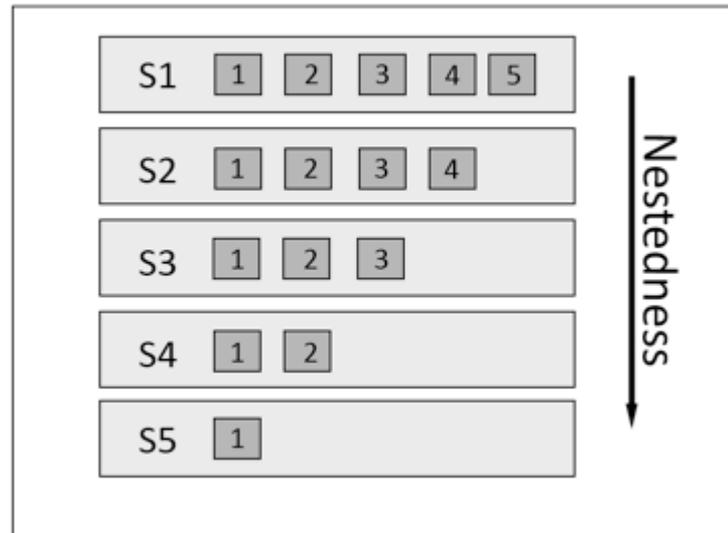

- Calcareous tubeworms
- Midshipman fish
- Orange sea cucumbers

# Q1: Species recovery post regulations

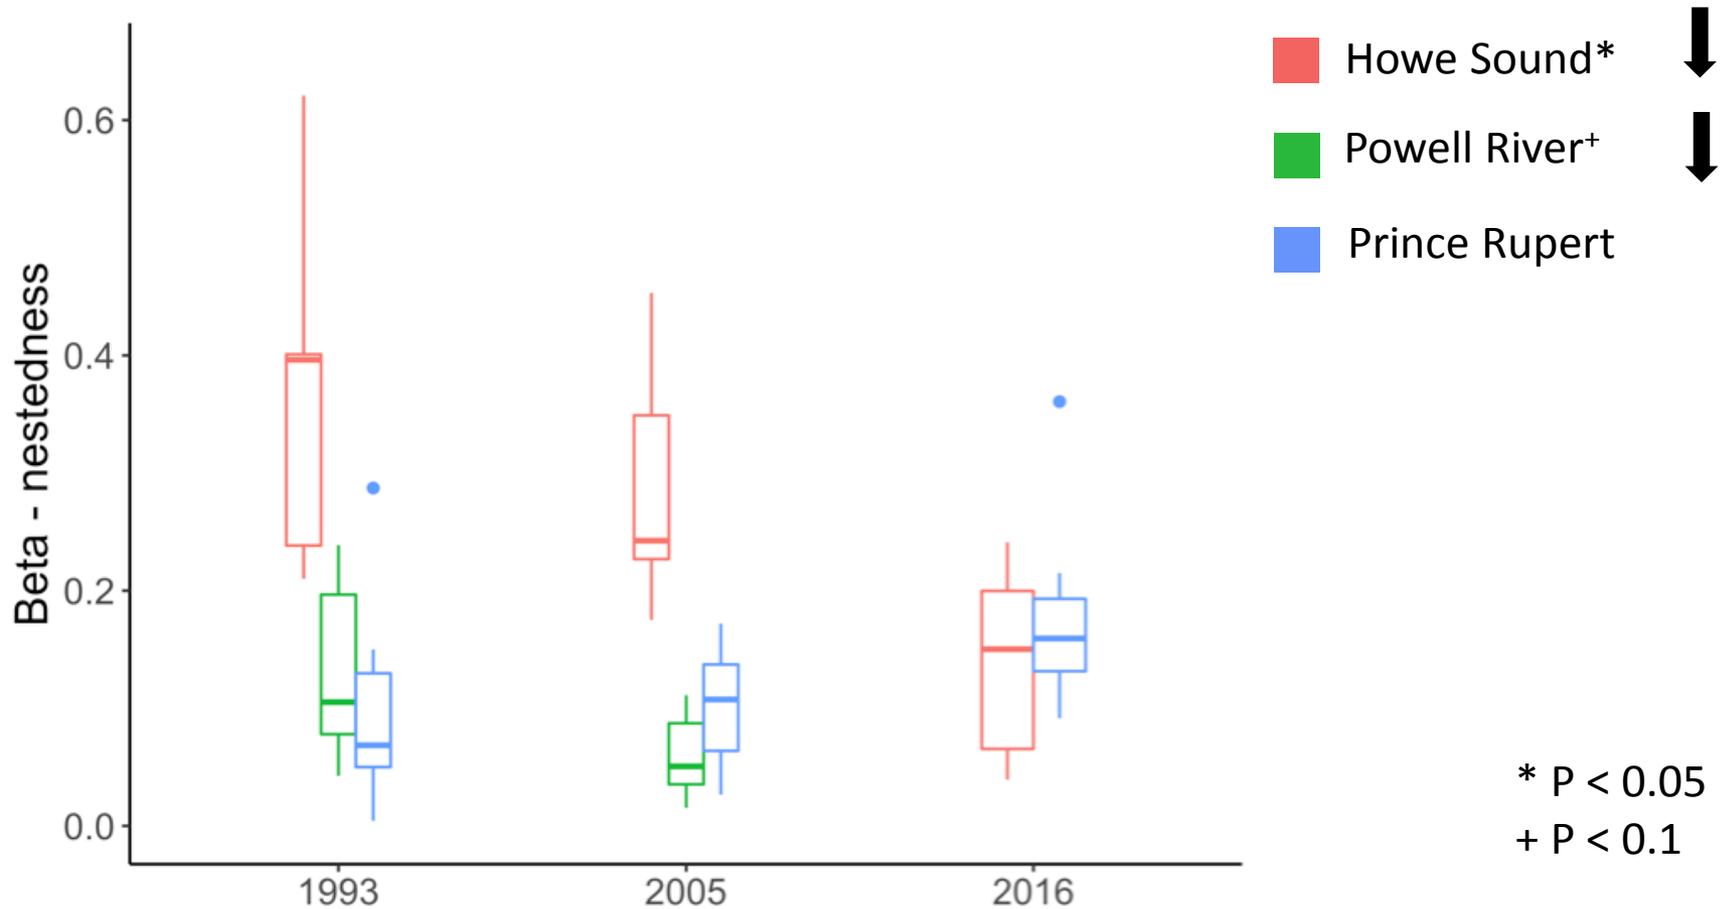

# Q1: But how are they recovering?

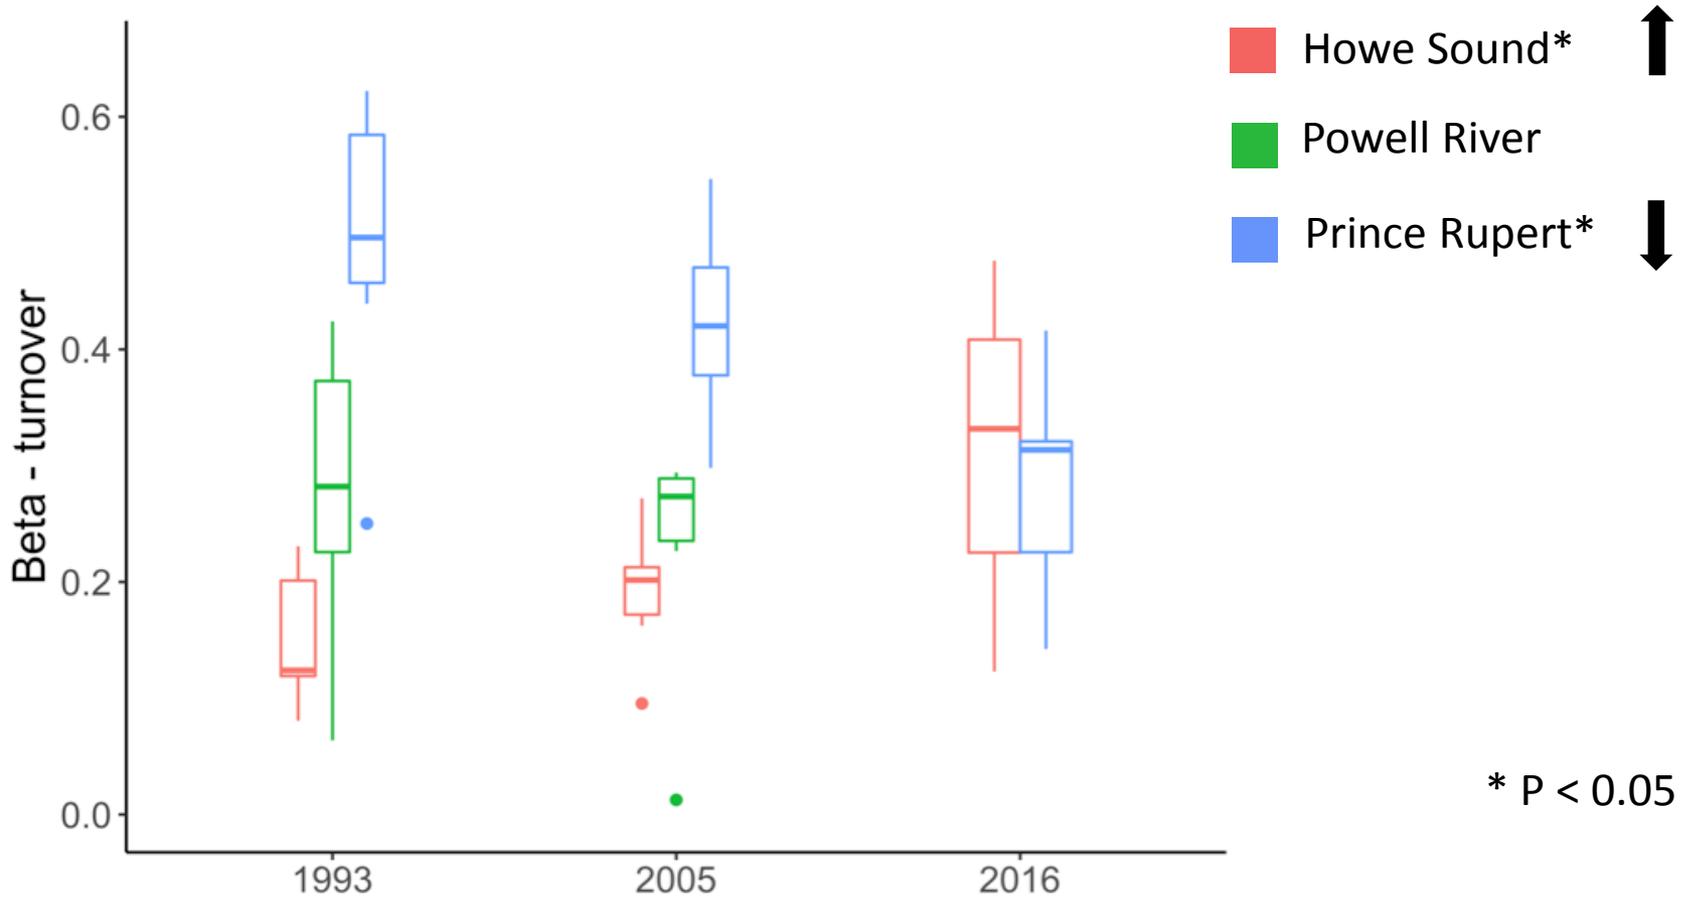

Adapted from  
Baselga 2009

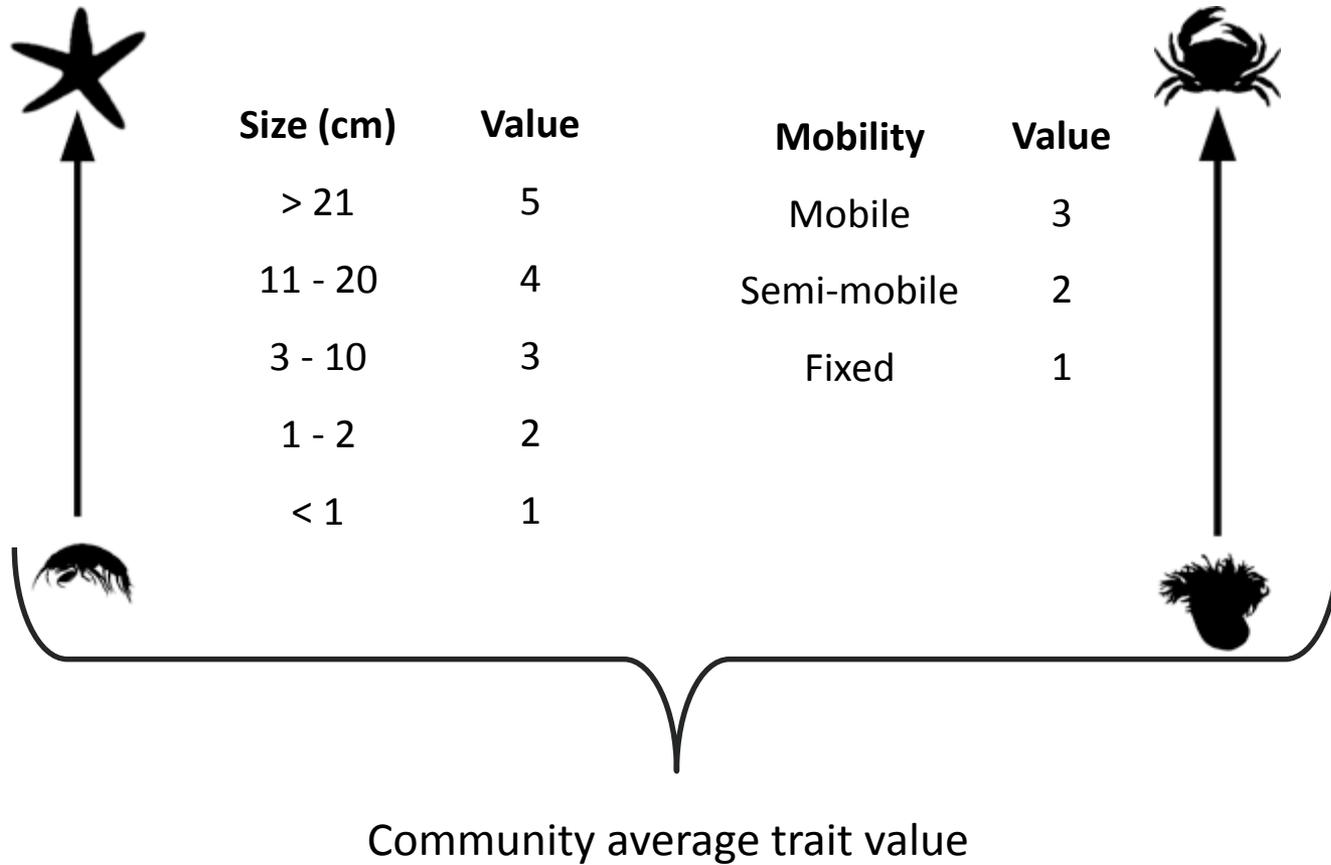

# Q1: Species nestedness

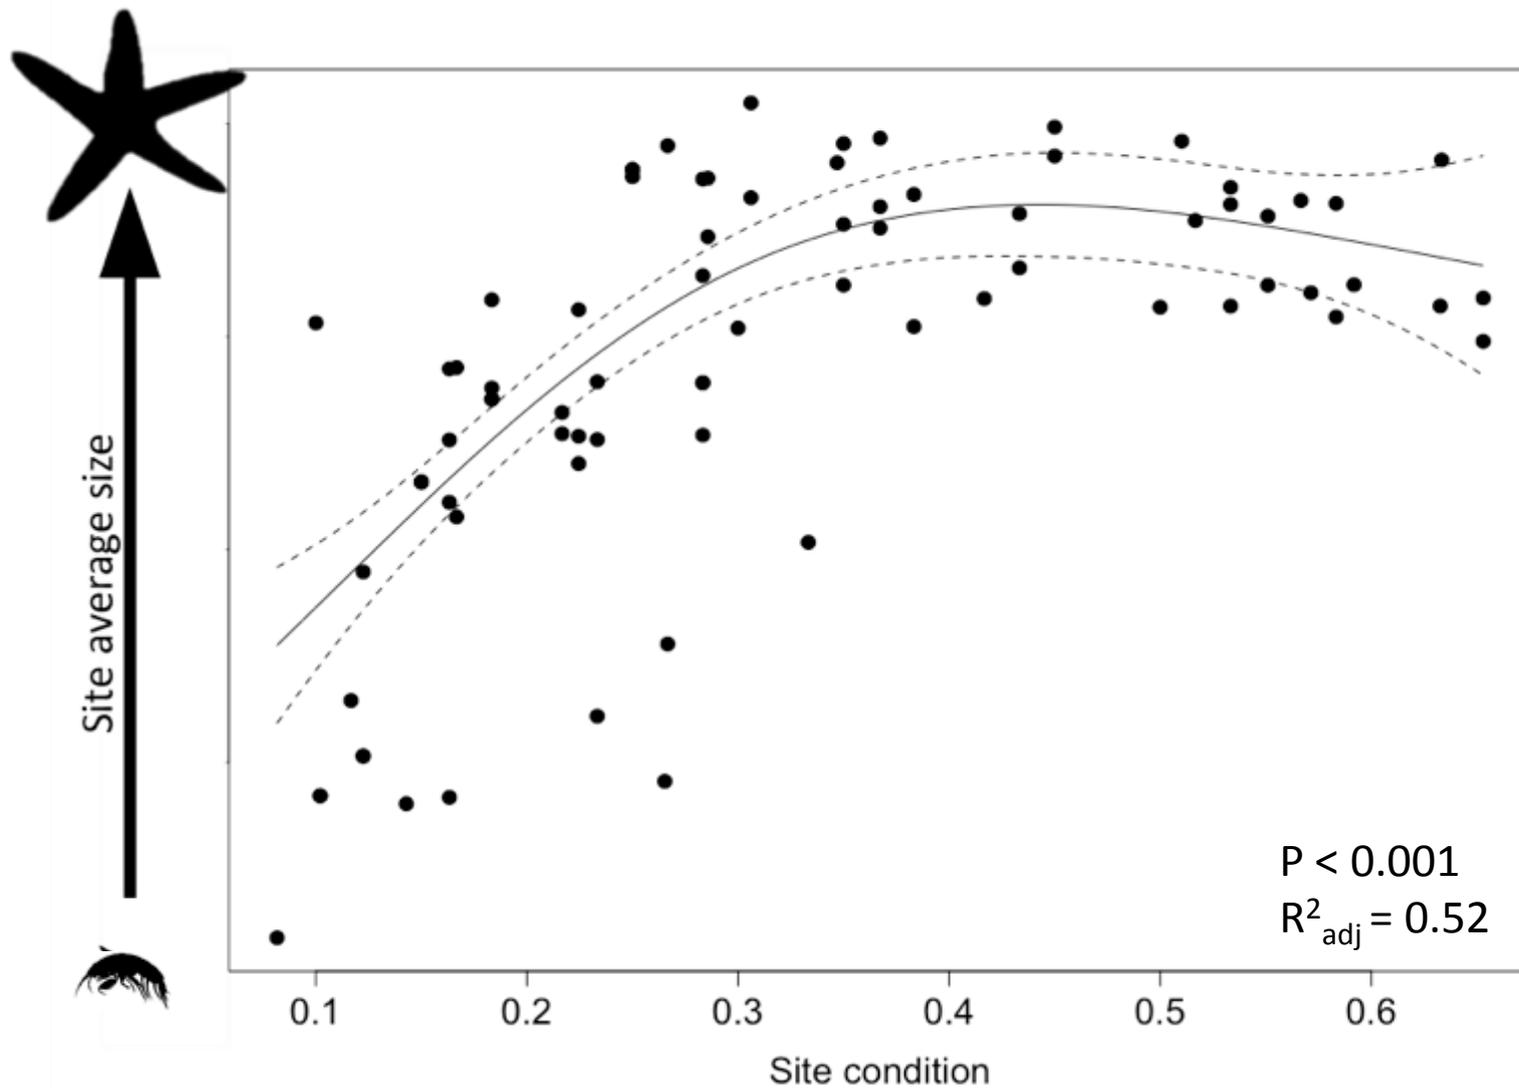

# Q1: Species turnover

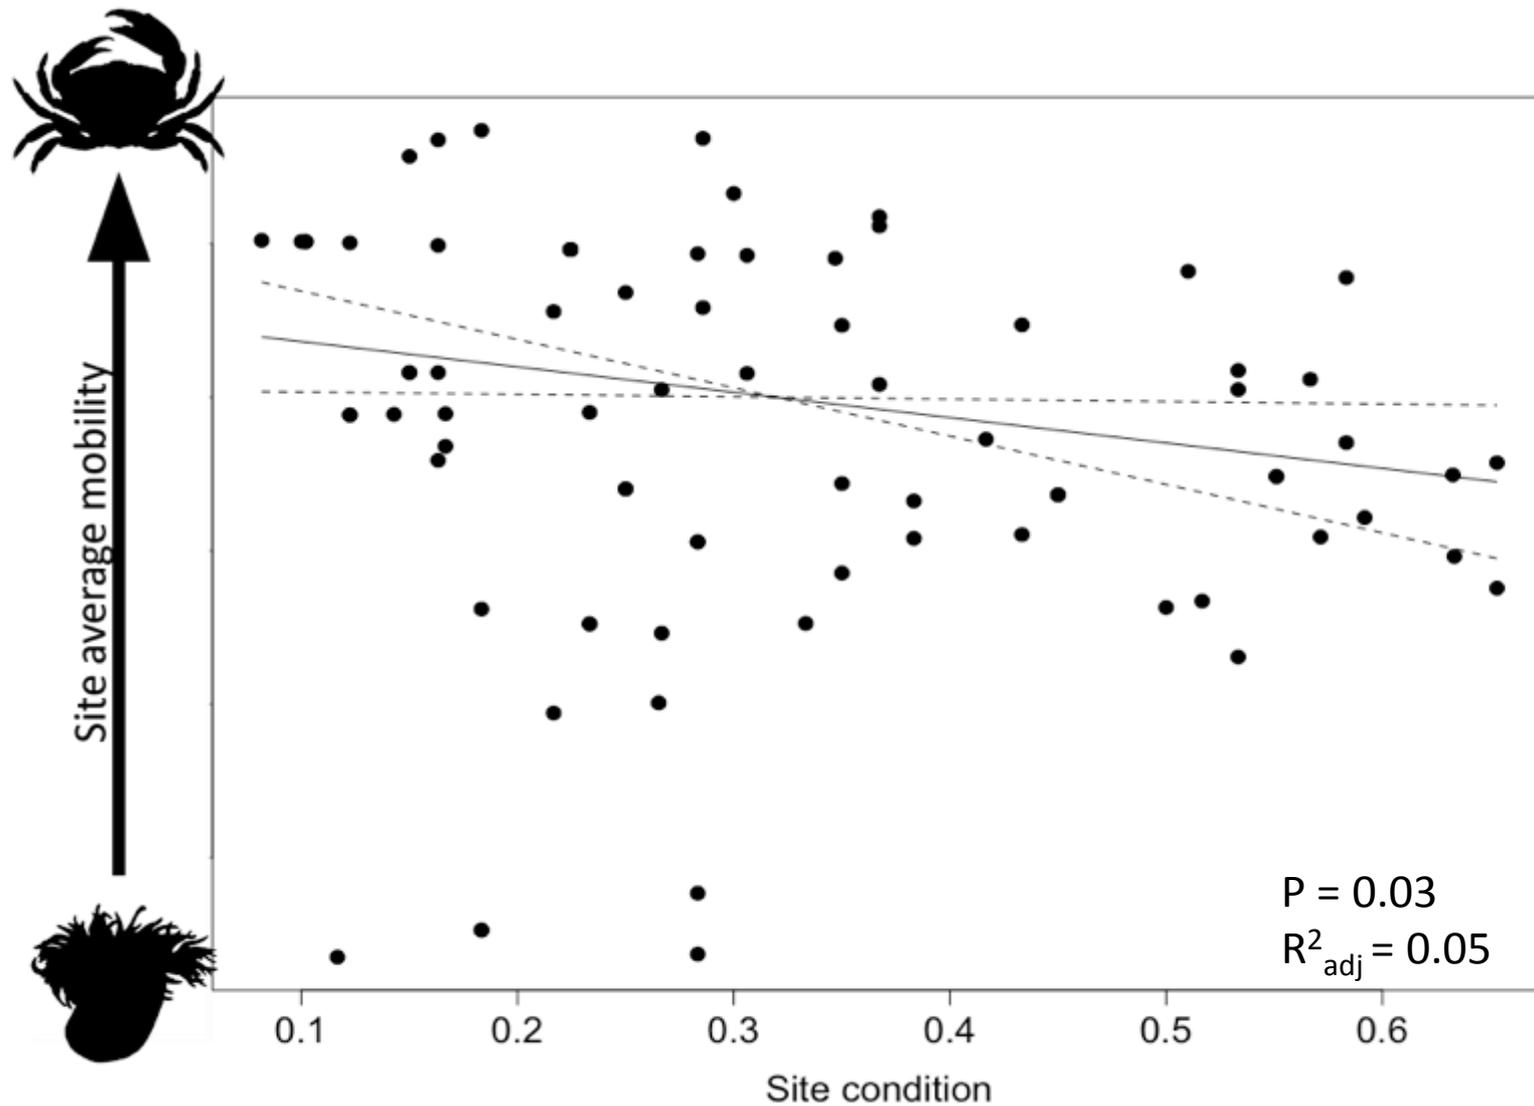

# Q2: Trait assignment

# Q2: Which traits thrive?

## Q2: Which traits thrive?

## Q2: Trait implications

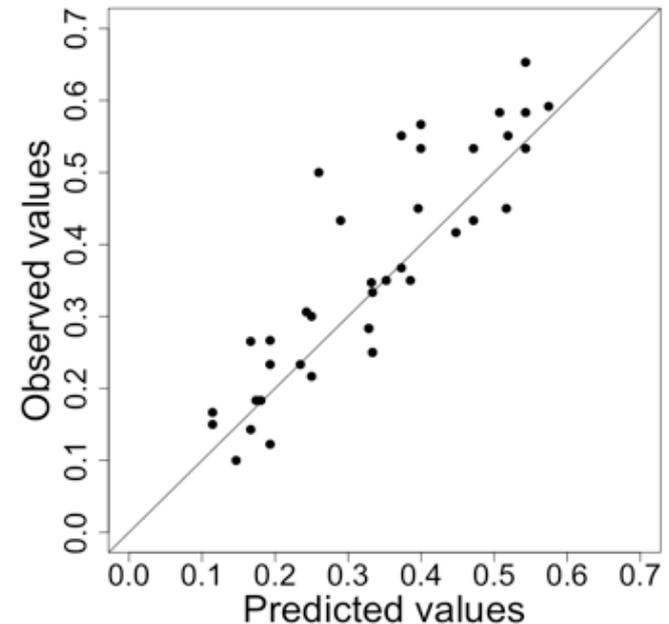

&

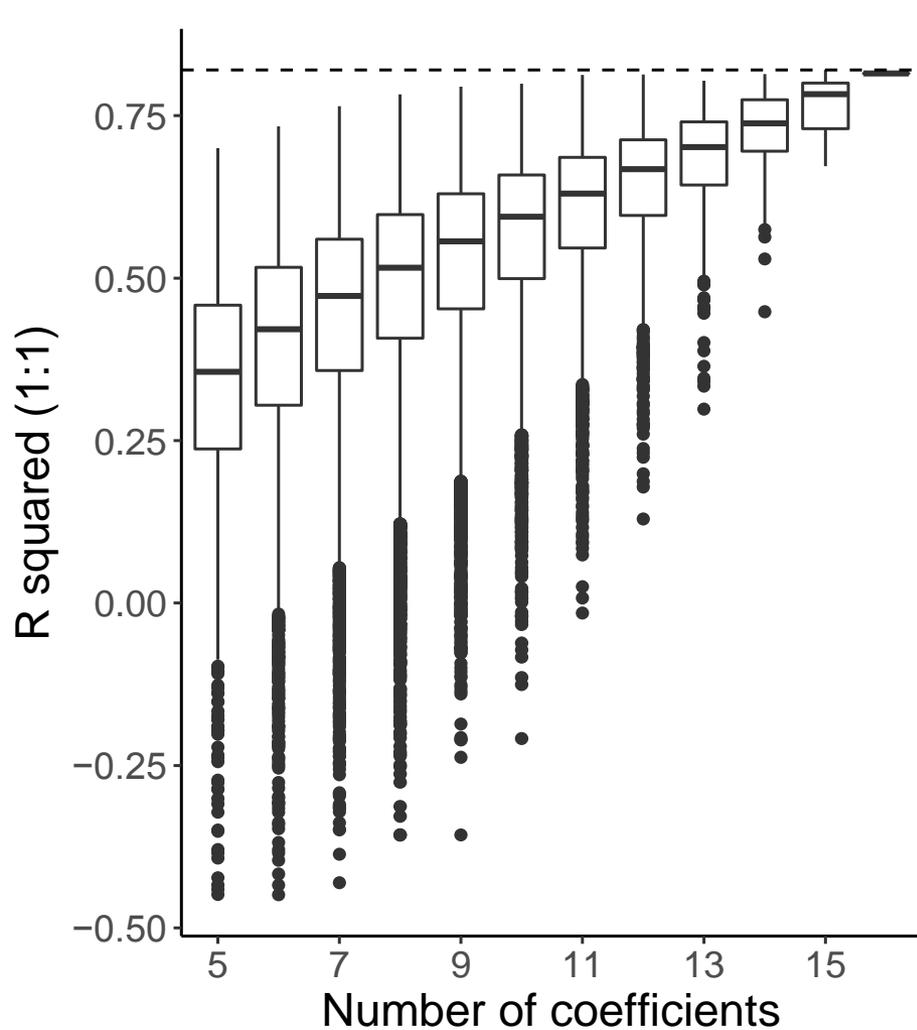

# Q3: Determining indicator species

- 1) Split data into a) training set & b) test set
- 2) Build training models predicting condition with different combos of the 15 species as predictors
- 3) Assess predicted values against independent test data ( $R^2$ )

# Q3: How many species?

Most common species coefficients

73 % "accuracy"

# Take Aways

- 1) Mill pollution reduced species richness
- 2) Recovery *can* occur naturally
  - Beta diversity provides additional insights
- 3) Pollution selects for smaller, mobile species
- 4) It is possible to assess the condition of a site based on a subset of species (with good accuracy)

# Contaminated Sites Applications

- Use of community traits index more informative than presence/absence surveys- insight into **community health**
- Identify sites which are not recovering naturally, candidates for restoration efforts
- Shoreline Cleanup & Assessment Technique (SCAT)
  - Use indicator species survey technique for **oil spill** response baseline surveys - time restrictive, easily train volunteers
