12 October 2018

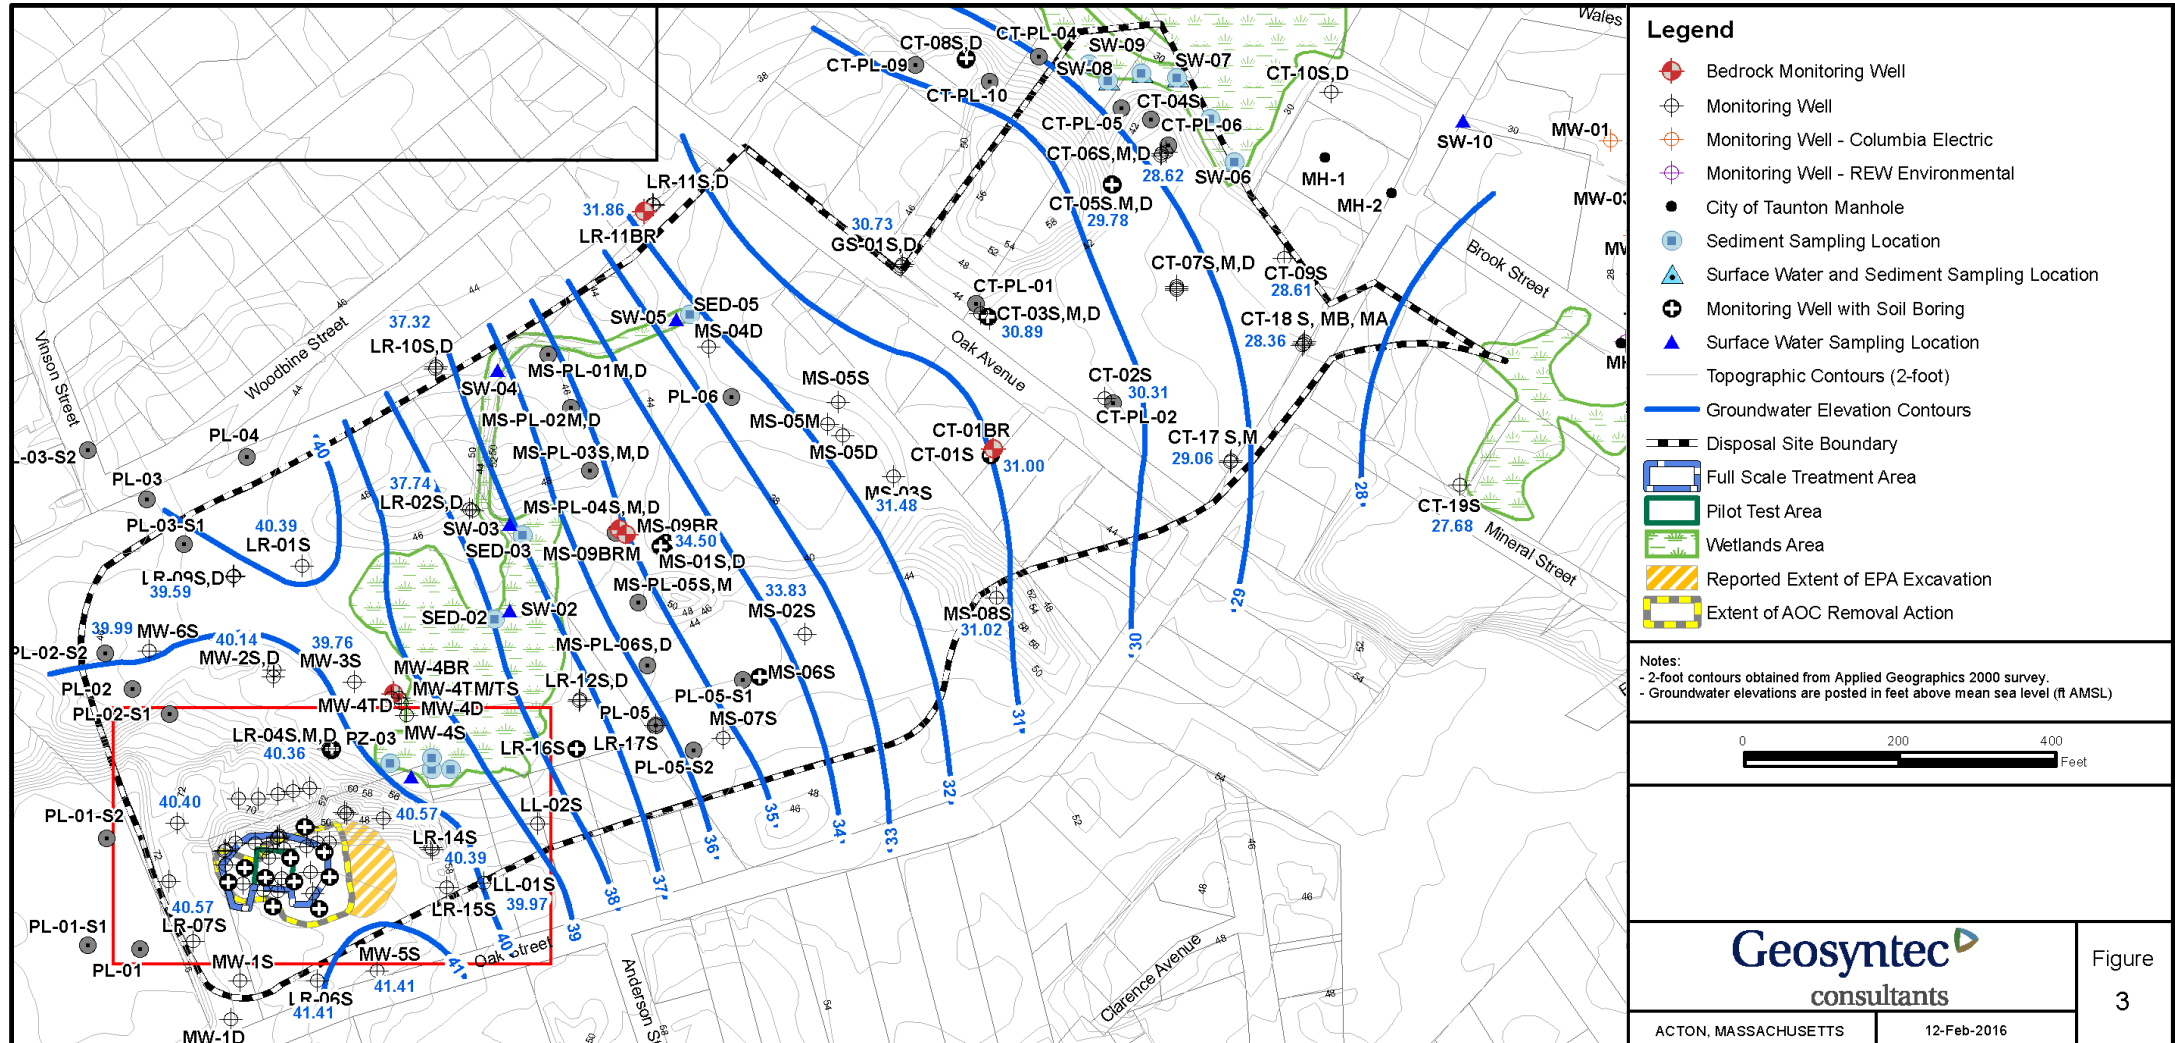

- How do we currently visualize environmental data?
- How does 3-D printing fit into that toolbox?
- How does 3-D printing work?
- Case Studies
- Potential Applications for 3-D Printing
- Model Scope and Cost

What do we do with all of that data we collect?

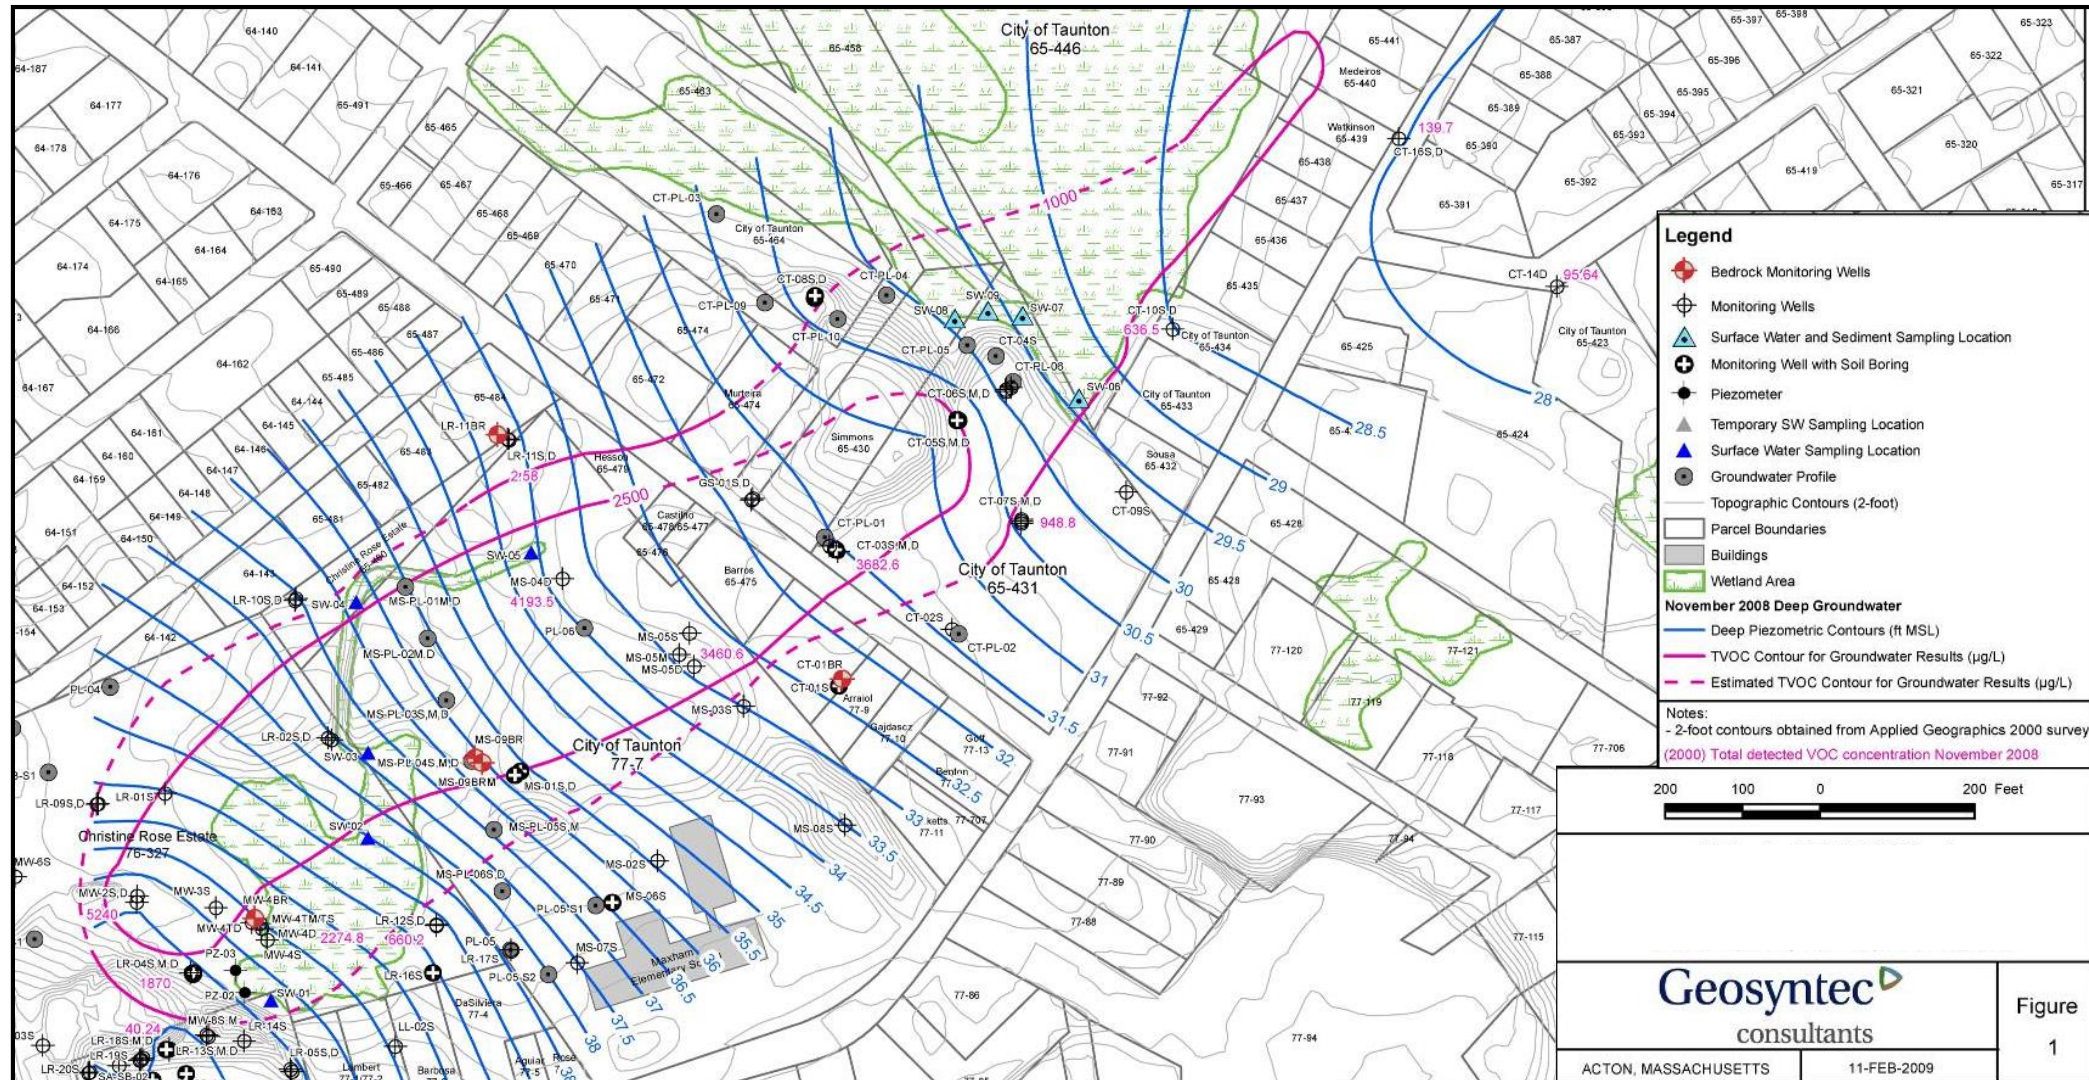

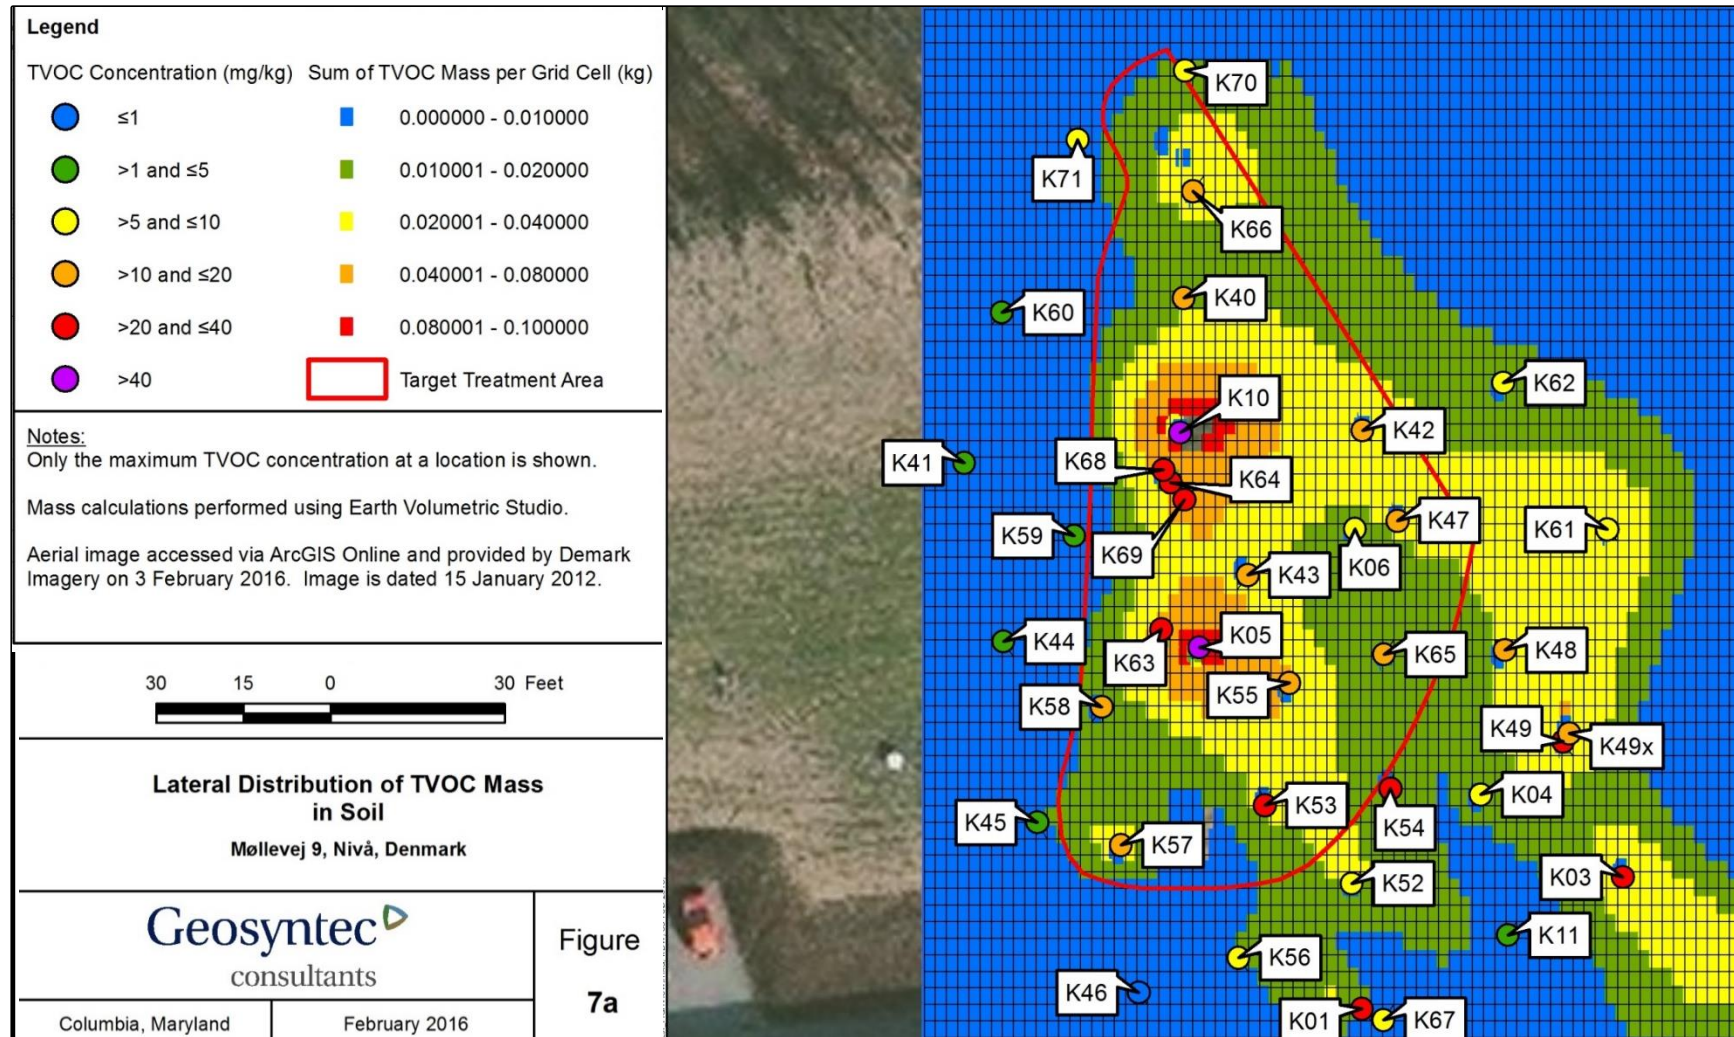

Contour it (Groundwater)

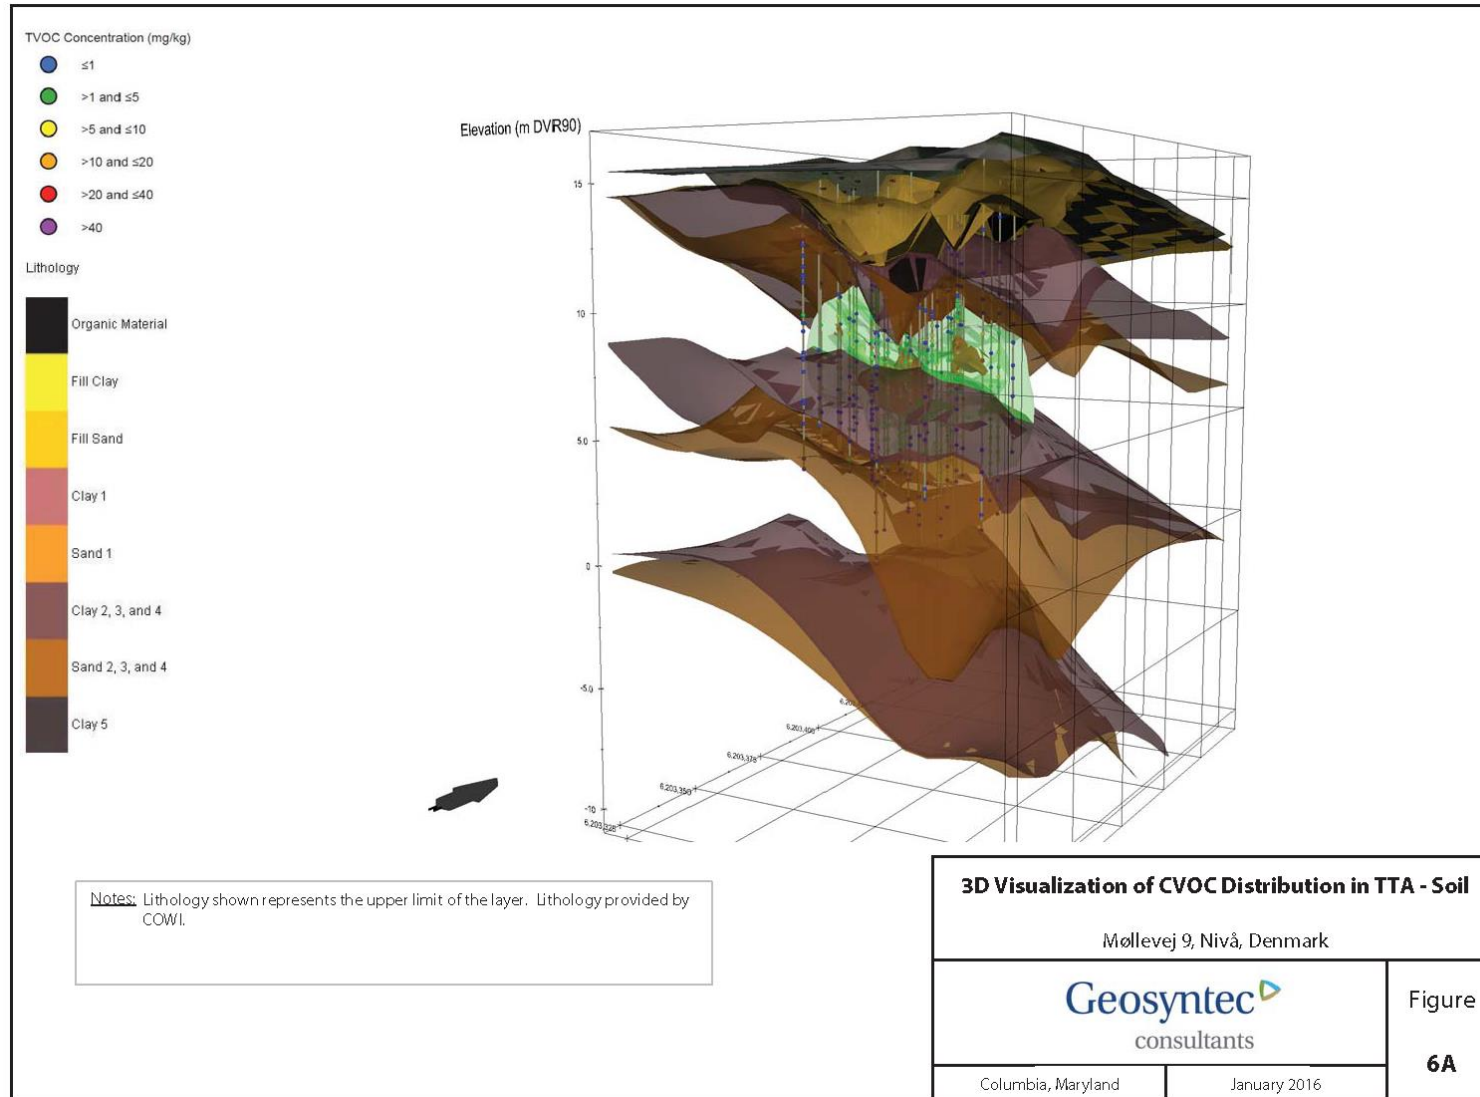

Contour it (Groundwater Concentrations)

Interpolate it (Soil Concentrations)

Model it in 3-D (Soil Concentrations and Geology - EVS model)

Slice it (Soil Concentrations and Geology)

Why is a 3-D Printed Model Better?

Why is a 3-D Printed Model Better?

- 3-D printing uses additive manufacturing to create physical models from digital 3-D structures.
- Printer costs range from \$500 to \$50,000+.
- Raw materials range from \$20-\$100/kg.
- 3-D printing services are becoming widely available for rapid prototyping and small-scale manufacturing.
- Visualizing environmental data and site geology is a novel application for 3-D printing.
- Geosyntec has been using 3-D printing since 2013.

Digital 3-D models can be created in many software packages:

- AutoCAD
- EVS
- EarthVision
- Blender
- Rhino

Converting a digital 3-D model to a physical model requires the following steps:

- Convert your 3-D model to file format used for 3-D printing (.stl file)
- Process (or “slice”) the model into the file that printer uses to create the shape

Converting a digital 3-D model to a physical model requires the following steps:

- Select material and color (ABS, PLA, Nylon, Flexible polyurethane, and many more)
- Print!

Printer builds model in layers (slices) from the bottom up.

Post-Process/Finish the model:

- Trimming

- Sanding/polishing

- Acetone washing (smoothing)

How did we get started? DPT Jet Injection Tool

Digital 3-D Model
(created in AutoCAD)

Case Study #4 - Tabletop Model - Chemical Facility in Brazil

**Gap in
Aquitard**

**Gap in
Aquitard**

- **Litigation Support** – Communicating with jurors or other non-technical participants in lawsuits.
- **Client/Regulatory Communications** – Communicate conceptual site models and remediation achievements to clients and regulators.
- **Stakeholder/Public Meetings** – Facilitate meetings with stakeholders, including PRPs and community groups.

- Develop EVS Models Geared Toward 3-D Printing
- Convert/Print Existing Digital 3-D Models
- Model Costs Range from \$5k to \$50k+ based on size and complexity
