

# Light Petroleum Biomarker Mixtures: Challenges in Forensic Investigations

*Detlef Birkholz, Chuck Jochems and Milan Ralitsch*

**Birkholz, Consulting**

# Site Setting

- Site is located in Whitehorse, Yukon Territory, Canada
- North of 60° with typically cold winters
- Current site is part of a much larger historical industrial site with multiple potential sources of fuels

Map Image Source:

# Phase II ESA

Completed two rounds of investigation in 2016

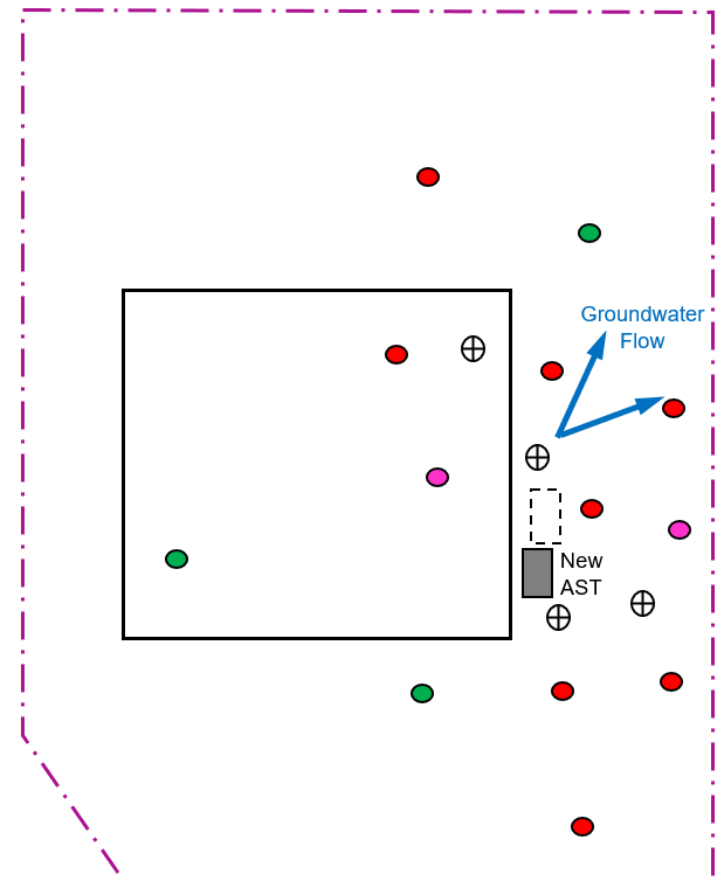

- 4 BHs and 12 MWs
- 4 interior holes, but locations were limited by available access
- Depth to groundwater  
4.5 to 5.0 m below grade
- Groundwater flow is to NE
- Silts with sand lenses found
- Some limitations noted with commercial analyses

# Assessing Liability

## Other sources of contamination possible?

- Gasoline and heating oil identified
- Other sources were possibly located up to 15 m away from the former tank in silty soils?
- Age of spill and related contaminants unknown
- Tenant to cover their liability
- Free product - secondary source
- No utility information from City

# Forensic analyses proposed

## Based on Results of 2018 Monitoring Round

- June 2018, 2 years after Phase II ESA
- Significant product found
- LNAPL and water samples collected w/ legal protocols (prepared by Birkholz)
- Lab analyses performed by Paracel Labs in Calgary, Alberta, c/o Dr. Ralitsch

# Forensic Analytical Methods

- Gas chromatograph / mass spectrometer
- Use of a high-resolution capillary column (PONA column)
- PIANO Analysis looks at paraffins, isoparaffins, aromatics, naphthenes, and olefins (GC/MS-SCAN)
- In addition, analytical procedure advocated by the Center for European Norms (EN 20xx) for light to heavy petroleum spills. Data collected for 44 compounds. (GC/MS-SIM).
- All samples were analyzed in duplicate.
- Legal sampling protocols complete with duplicates, field blanks, rinse blanks and trip blanks

# LIST OF SAMPLES

Client I.D.	Matrix	Test(s) Required
MW 16-10	LNAPL	Forensics
MW 16-7	LNAPL	Forensics
MW 16-7 (Field Duplicate)	LNAPL	Forensics
MW 16-2 (source)	LNAPL	Forensics
MW 16-6	Water	Forensics
MW 16-4	Water	Forensics
MW 16-5	Water	Forensics
MW 16-14	LNAPL	Forensics

# Alkanes and Alkylated Benzenes

# Refining

This simplified drawing shows many of a refinery's most important processes.

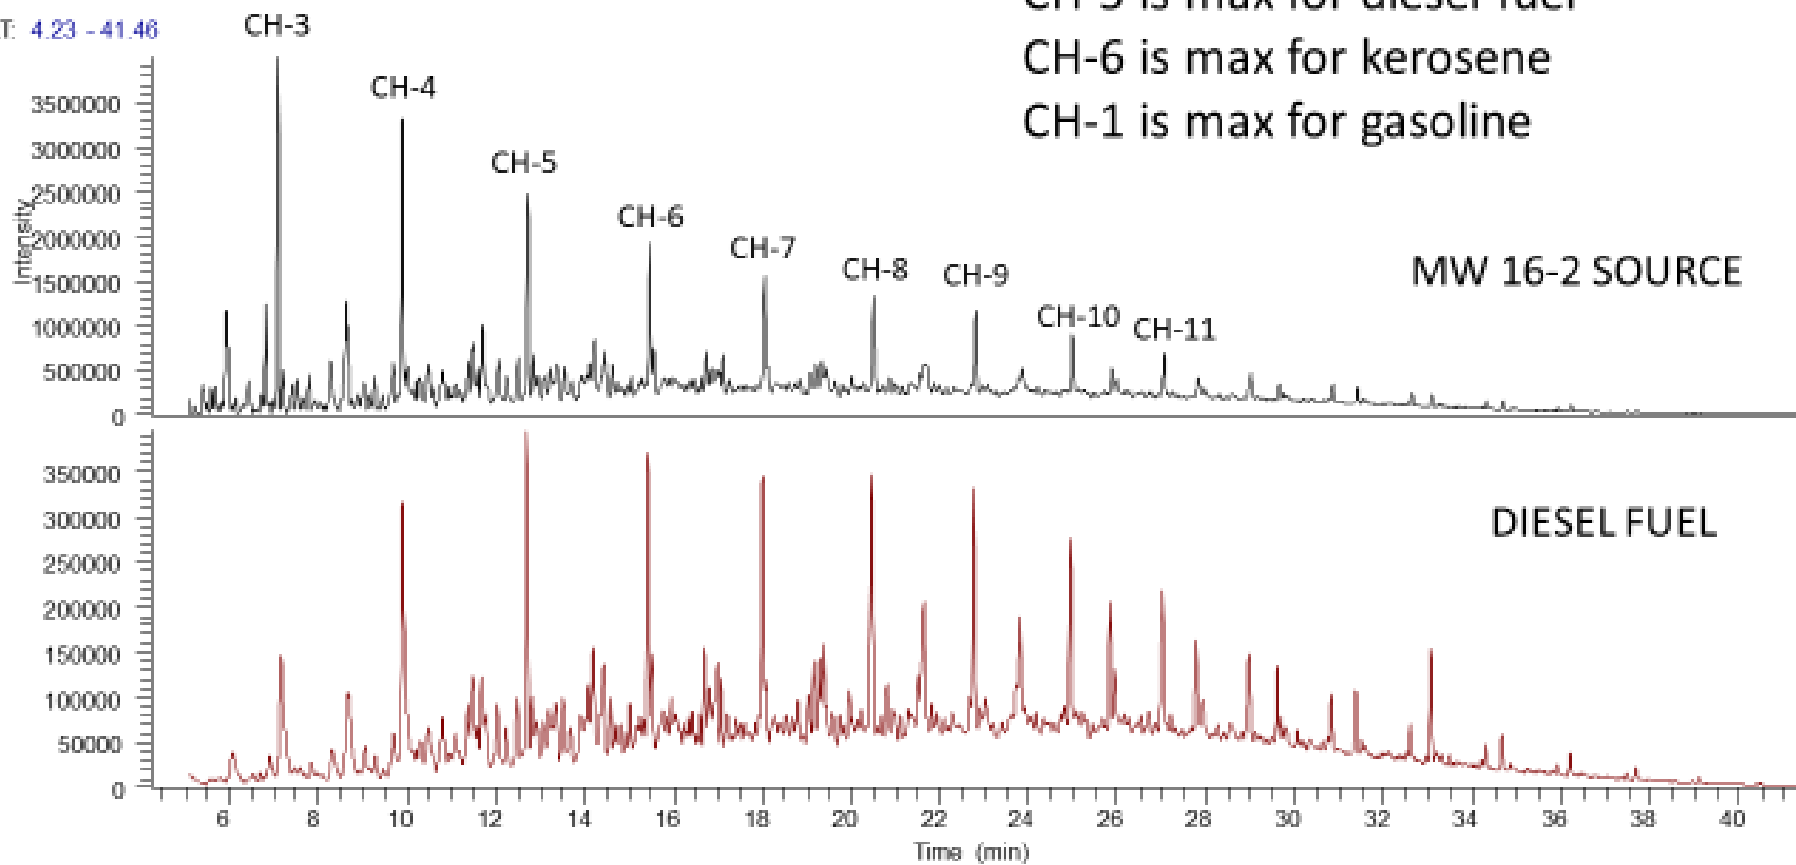

# WINTER DIESEL

- Under winter conditions summer diesel (Diesel No. 2) can gel-up and turn into a gelatinous mess.
- To stop this from happening Winter diesel (Diesel No. 1) is prepared by adding kerosene which helps lower the pour-point & cloud point of the diesel to prevent it from gelling up and keep it flowing easily.
- Ratio of diesel to kerosene is: 80:20; 70:30; 60:40 and 50:50 depending upon temperature in the winter.
- Winter Diesel usually a mixture between Diesel No.1 and No.2. Ratios of 80:20 and 50:50 have been used  
No.1 : No.2

# ALKYLCYCLOHEXANES

RT: 4.23 - 41.46

## MW 16-2 SOURCE

- Is clearly a mixture containing gasoline and diesel fuel
- No evidence of kerosene
- Why they mixed gasoline with diesel is unknown, perhaps to make a winter diesel, ie. keep diesel fuel from gelling up
- This mixture represented the source of the spill material.

# Comparison Source and Water Samples

RT: 4.23 - 41.46

# COMPARISON SOURCE AND LNAPL

RT: 4.31 - 41.77

# COMPARISON FIELD DUPLICATE

Comparison of the normative ratios - relative difference in %

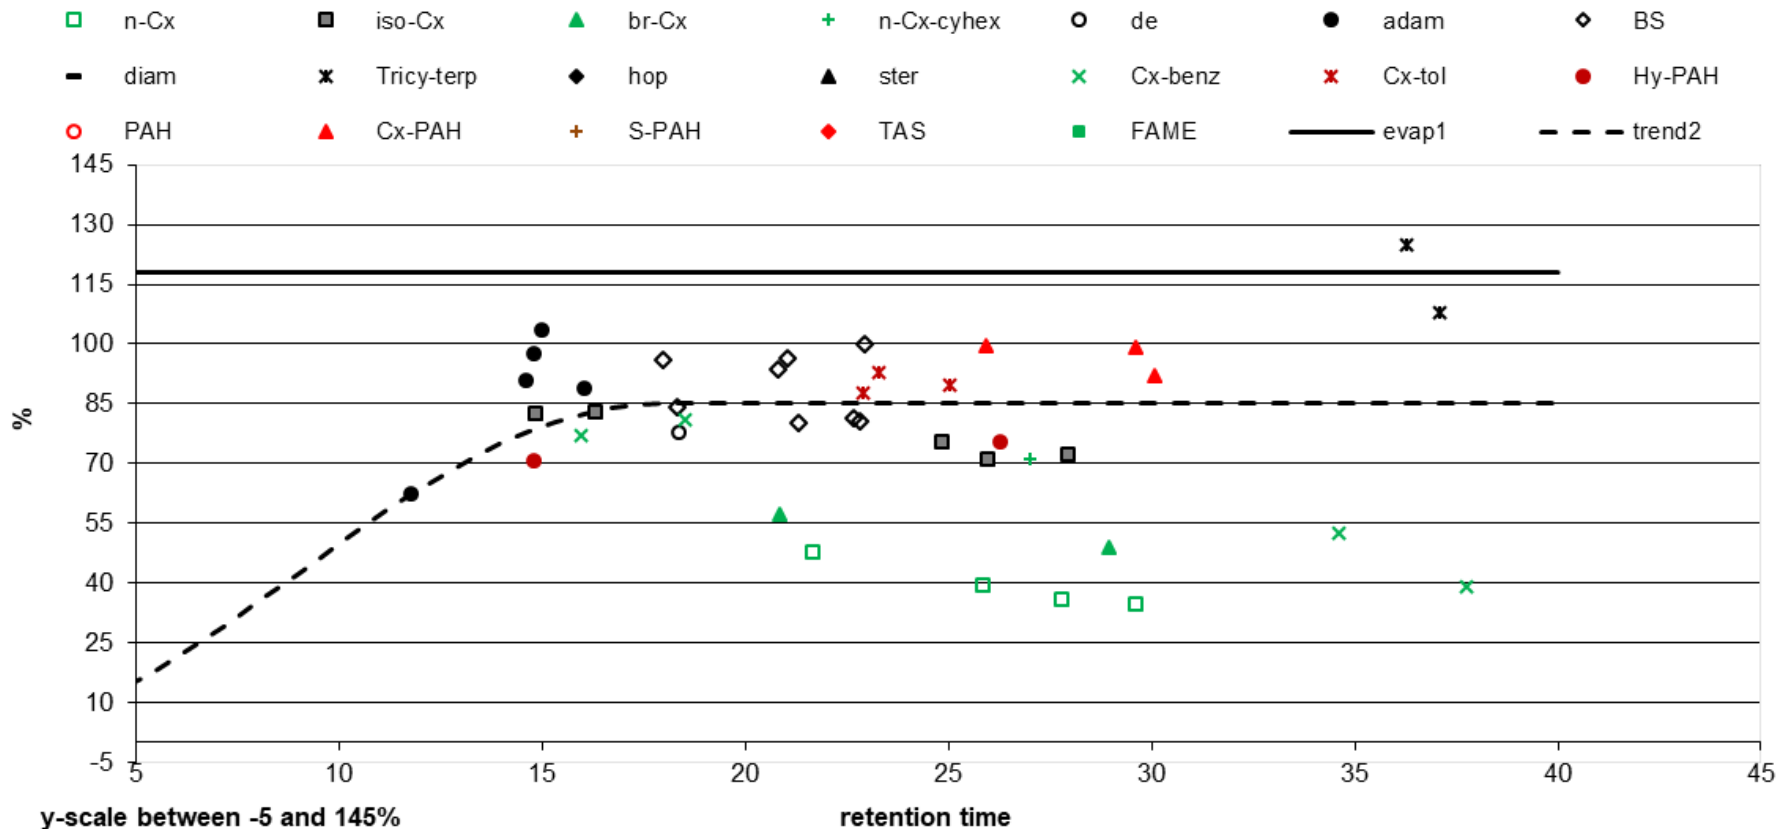

# Comparison of MW 16-14 and source

1825552-14 + 1825552-14 - 1825552-05 + 1825552-05 : PW-plot normalised to BS10

# Comparison of MW 16-14 and source

1825552-14 + 1825552-14 - 1825552-05 + 1825552-05 : PW-plot normalised to BS10

Lower levels of 1-M-Adam, n-alkanes, branched alkanes, sesquiterpanes, isoprenoids, alkylated benzenes, indicative of evaporation and biodegradation

# Comparison of MW 16-14 and source

13 normative ratios exceed 14% relative difference  
 Based on the GC/MS PW plots all can be explained by  
 weathering (evaporation and biodegradation)

We conclude that MW 16-14 is a positive match with source  
 MW 16-2

# LNAPL COMPARISONS WITH SOURCE

Sample ID	#-Flags	Explained by weathering	Conclusion
MW16-10	3	yes	Positive match
MW16-7	1	Yes	Positive match
Duplicate MW16-7	2	Yes	Positive match
MW16-14	13	Yes	Positive match

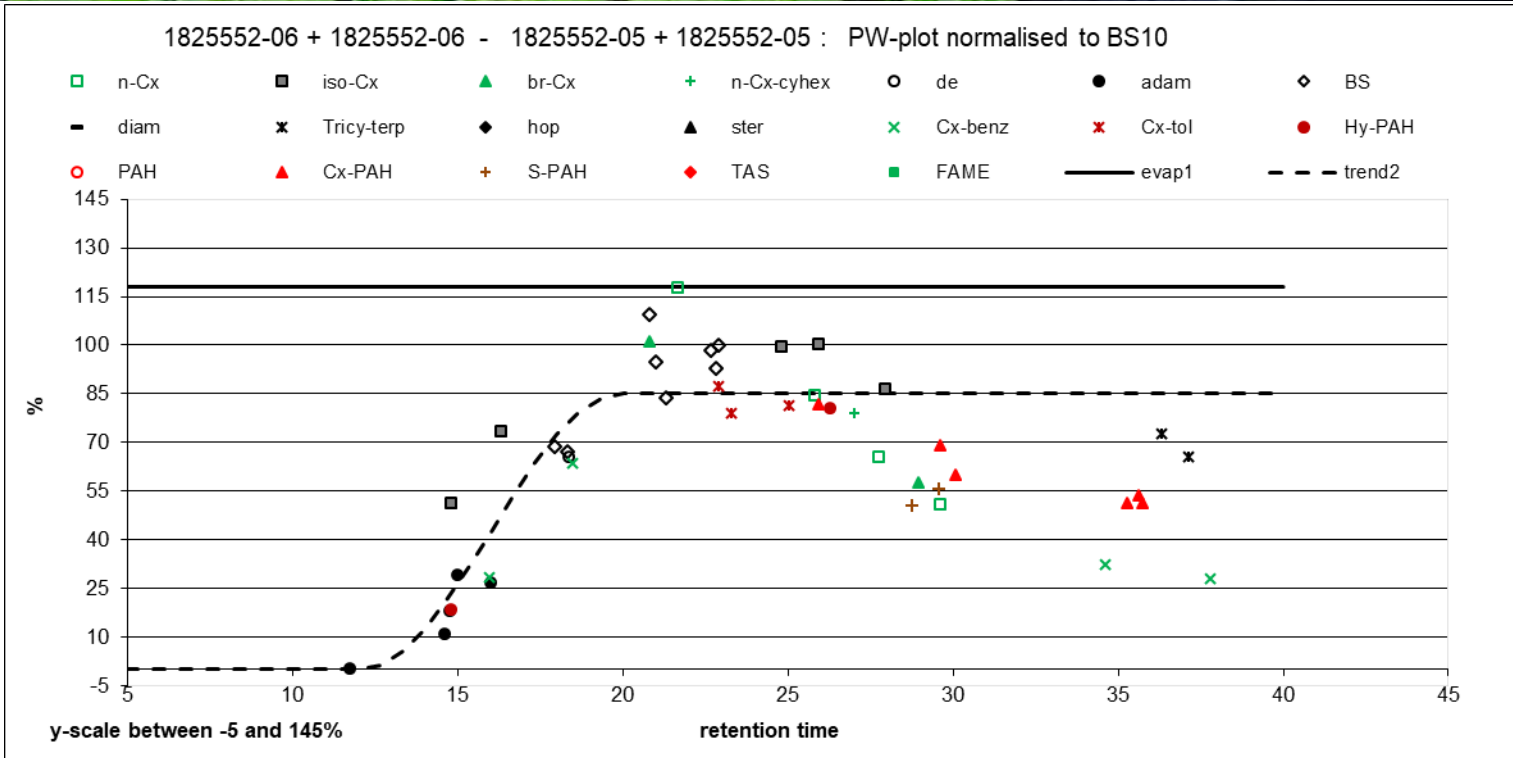

# Comparison of MW 16-5 water (-06) with Source (-05)

N-alkane pattern normalized to mean C 15-C16

# Comparison of MW 16-5 (water) with Source

**CONCENTRATION DIFFERENCE 40-FOLD**

# Comparison of Water Samples with Source

Sample ID	# of Flags	Explained	Conclusion
MW16-6	15	Yes	Positive match
MW16-4	12	Yes	Positive match
MW16-5	13	Yes	Positive match

# Conclusions

- LNAPL samples MW 16-10 MW16-7, its Duplicate and MW16-14 deemed a positive match with MW16-2 (source)
- Water samples MW16-4, MW 16-5 and MW 16-6 deemed a positive match with MW16-2
- Chromatograms can be misleading and reliance upon them for source sample comparisons can be erroneous.
- The same applies for chemical ratios
- GC/MS PW plots are essential in understanding the behaviour of petroleum biomarkers.
- They allow us to explain differences.
- For mixtures, concentration differences between source and spill can be a challenge for interpretation
